

MAJESTIC P.L.T. PROGRAM

MAJESTIC P.L.T. PROGRAM

DIVERSIFIED AND SUSTAINABLE SUPPLY CHAIN.

A B&L INTERNATIONAL INITIATIVE

MAJESTIC P.L.T. PROGRAM

EXECUTIVE SUMMARY.

MAJESTIC P.L.T. (Production, Logistics & Technology) is an initiative that seeks to leverage and increase **B&L International** current opportunities and capabilities, vertically integrating its common requirements to develop a sustainable system to support its operations, expand it to other customers, also open and establish new business around the globe.

B&L international is part of a group of companies with more than 50 years of experience in Real state development, food and beverage trading, logistics and aeronautical industry, also, is partner of major cruise ships companies to supply goods, several port developments, major hotel and entertainment developers and many more, that have provided the perfect scenario to establish a modern, sustainable and competitive network to support development and operations in a competitive way that benefits all the users of this network.

The MAJESTIC P.L.T Program seeks to leverage these capabilities developing three major areas:

- **PRODUCTION:** The FRESH-24project will establish MAJESTIC's primary supplier network across the USA, Latin America, and overseas. This network will consolidate a wide product portfolio that fulfills all our project and customer requirements for fresh, quality, and competitive products. It will also boost our customers' competitive advantage.

By sourcing directly from local farmers and small businesses, the project ensures fair pricing and consistent demand. This approach helps strengthen community livelihoods and fosters sustainable growth. As a result, the initiative supports farmers, empowers small businesses, generates new jobs, and positively impacts local economies.

Our commitment to social responsibility is integral to the MAJESTIC P.L.T. Program. In upcoming sections, we will highlight specific examples, such as the number of jobs created or new partnerships with local suppliers, to demonstrate the program's tangible benefits for the communities we serve.

- **LOGISTICS:** The Majestic Logistics project will integrate air, sea, and ground logistics to provide efficient service. This integration ensures products arrive on time, with top quality, and at an affordable cost to maintain competitiveness. By collaborating with leading distribution chains and logistics operators plus in-house capabilities, we can offer flexible delivery options and ensure reliable support tailored to each user's

MAJESTIC P.L.T. PROGRAM

needs. For example, users will benefit from expedited shipping, real-time tracking, and customized logistics solutions that adapt to changing requirements.

1. **TECHNOLOGY:** Advanced-X1 will deliver technological solutions that integrate all program components, minimizing intermediation, bridging the gap between producers and buyers, and establishing both proactive and predictive supply systems. The platform will implement a “bulk purchase” methodology to reduce costs and optimize logistics efficiency for deliveries, directly enhancing program profitability and user experience.

This initiative is guided by an accomplished team with a collective experience exceeding 400 years. Through their leadership, MAJESTIC P.L.T. is well-positioned to drive meaningful progress in international trade, particularly by fostering balanced exchanges between the USA and other countries while effectively addressing real-world risks and challenges.

MAJESTIC P.L.T. is set to revolutionize global commerce by launching innovative aeronautical training programs and advancing technological solutions within local communities. For example, the program extends training opportunities in key fields such as aviation, technology development, and logistics, focusing on high-value roles like pilots and mechanics.

By investing in local talent and providing skill development, MAJESTIC P.L.T. not only supports its own operational needs but also creates lasting career pathways for community members. This approach helps ensure long-term growth and resilience, strengthening communities for generations to come.

1. CORPORATE OVERVIEW

1.1. Company Background

B&L International is involved in several strategic projects and profitable companies around the globe. These include port development initiatives for Royal Caribbean and a Liquor and beer distribution network in the Caribbean islands. The company's deep understanding of its diverse business activities provides a solid foundation for identifying, planning, and developing the essential qualities needed to enhance and expand the group's operations. These transversal characteristics include standardized logistics processes, shared technology platforms, and unified management practices across different projects. By implementing these strategies, Majestic P.L.T. can reduce program implementation costs and create an internal niche market. This approach also promotes sustainability and short-term profitability for the group.

Some of the partner companies are:

1.1.1. B&L Worldwide

B&L Worldwide, in collaboration with Royal Caribbean Cruise Lines, is developing a landside port program to expand cruise operations in the Caribbean. The program includes eight new ports across various islands, with current planning and development efforts focused on the Martin Quarter in St. Maarten.

B&L International will serve as the development and asset manager, and general manager for Platinum Harbor Holdings (PHH) Hard Rock project, recognized as the St. Martin Quarter Development Company (SMQDC).

The company will manage manufacturing, logistics, and food and beverage procurement and distribution, sourcing products globally, with an emphasis on suppliers from the United States. Distribution will extend throughout the Americas for the flower and beverage sector in partnership with international liquor, trade, and tobacco organizations.

MAJESTIC P.L.T. PROGRAM

B&L International will also export fresh organic products from Pennsylvania, Maryland, Virginia, and North Carolina, cooperating with major food distributors such as Proficient Foods, Cheney Brothers, and other domestic and international partners.

With distribution centers in Pennsylvania, North Carolina, and Florida, the organization has infrastructure positioned to support Majestic P.L.T. in integrating and complementing proposed operations.

1.1.2. ILTT. (International Liquor and Tobacco Trading N.V.)

ILTT is St. Maarten's first and largest spirits and beer distributor established since 1960. It has a long- and well-established exclusive relationship with many of the world's largest suppliers of leading international beverage, spirits, wines, and tobacco brands, with an extensive and efficient distribution network throughout St. Maarten/St. Martin and the neighboring islands, including a sister company on St. Barthelemy.

ILTT is strategically integrated with key retail locations at the main port tender docks and Princess Juliana airport, servicing both cruise and air passengers. ILTT expanded its retail role on the island and within the region through the strategic partnership with Royal Caribbean Cruise Line.

ILTT counts with state-of-the-art facilities and technology, and a strong and diversified portfolio ensuring its long-term stability and growth potential, and its permanently seeking for opportunities in working closely with its strategic partners brand owners and suppliers in providing a well proven brand building and operating model, and the most efficient route to market on St. Maarten and neighboring islands.

1.2. MAJESTIC P.L.T. CORPORATE STATEMENT.

1.2.1. VISION:

To become the leading vertically integrated platform for global production, logistics, and technology-delivering sustainable, high-margin solutions that empower communities and unlock scalable growth across international markets.

1.2.2. MISSION:

MAJESTIC P.L.T. is building a resilient, tech-enabled supply ecosystem that consolidates sourcing, streamlines logistics, and minimizes intermediation. By leveraging B&L International's global footprint and strategic partnerships, we deliver cost-efficient operations, unlock new revenue channels, and create long-term value for stakeholders and communities alike.

1.3. Leadership and Team

MAJESTIC P.L.T. is led by a uniquely qualified team whose combined expertise spans global aviation, enterprise logistics, agricultural production, international trade, and community development. With decades of executive leadership across American Airlines, Cheney Brothers, and national defense institutions, the team brings operational precision, regulatory fluency, and strategic foresight to every layer of the initiative. Their experience includes over 30,000 cumulative flight hours, oversight of multi-billion-dollar logistics networks, and direct agricultural exports, ensuring that MAJESTIC's supply chain is not only scalable but deeply rooted in real-world execution.

This leadership coalition reduces risk through proactive decision-making, cross-sector coordination, and built-in redundancy across production, logistics, and technology. Their backgrounds in aeronautical R&D, sustainable sourcing, and global commerce allow MAJESTIC P.L.T. to anticipate challenges, adapt quickly, and deliver resilient solutions that benefit both investors and communities. With deep ties to government, industry, and grassroots networks, the team is positioned to unlock high-trust corridors, accelerate market entry, and build a vertically integrated system that evolves with global demand.

MAJESTIC P.L.T. PROGRAM

Captain Craig Baptiste.

Captain Craig Baptiste brings unparalleled expertise in global air carrier operations, backed by over 23,000 flight hours across a wide spectrum of commercial aircraft including Boeing B737, B757, B767, B777, B787 and Airbus A330, A321, A319. A graduate of both Embry-Riddle Aeronautical University and the U.S. Air Force Academy, his career reflects a deep commitment to operational excellence, safety, and strategic aviation logistics. His leadership in high-stakes environments and mastery of complex air systems positions him as a cornerstone of the MAJESTIC P.L.T. initiative, ensuring that the logistics and aeronautical components of the program are executed with precision, resilience, and global scalability.

Lt. Col.® Mauricio Zuleta

Lt. Col.® Mauricio Zuleta brings a rare blend of operational aviation expertise, advanced research leadership, and entrepreneurial acumen to the MAJESTIC P.L.T. initiative. With over 7,300 flight hours across both fixed and rotary wing aircraft, his aeronautical command is matched by his strategic roles as Director of Science & Technology for the Colombian Air Force (COLAF) and Director of Advanced R&D Programs for the Colombian Ministry of Defense. His background as an I.M.A. Aeronautical Administrator and his experience as an export flower grower reflect a unique ability to bridge high-tech systems with real-world supply chain dynamics. Mauricio's multidisciplinary insight ensures MAJESTIC P.L.T. is not only technically sound but also globally adaptive, capable of innovating across logistics, production, and technology with precision and purpose.

Mr. Robert Asprilla

Mr. Robert Asprilla is a seasoned community strategist and international marketing expert whose work bridges grassroots engagement with global impact. A graduate of the University of Maryland in International Marketing, he has co-founded the Afro Interamerican Forum on Climate Change in collaboration with MIT, underscoring his commitment to sustainability and inclusive development. As CEO of Global Passport Academy, he has led initiatives that empower underserved communities through education, mobility, and entrepreneurship. His deep expertise in stakeholder engagement and cross-sector partnerships

MAJESTIC P.L.T. PROGRAM

makes him a vital force in MAJESTIC P.L.T.'s mission to build resilient, community-driven supply ecosystems. Robert's leadership ensures that the program not only scales commercially but also earns trust and traction across diverse markets.

Mr. Bill Foley

Mr. Bill Foley serves as President and Chief Operating Officer of Cheney Brothers, one of the largest foodservice distributors in the United States. With decades of experience leading high-volume operations, Bill brings unmatched expertise in supply chain optimization, procurement strategy, and enterprise logistics. His leadership has driven Cheney Brothers' expansion into new markets, streamlined distribution networks, and enhanced service reliability across thousands of SKUs. As a strategic advisor to MAJESTIC P.L.T., Bill's operational insight and industry relationships provide a critical foundation for scaling the program's production and logistics pillars with precision, efficiency, and commercial viability.

Mr. George Hazy

Mr. George Hazy brings elite executive experience to MAJESTIC P.L.T., having served as CEO of Executive Air/American Eagle and as the former Chief Operating Officer of American Airlines. His leadership has shaped some of the most complex and high-performing aviation networks in the world, overseeing large-scale operations, regulatory strategy, and international expansion. With a proven track record in scaling logistics infrastructure and navigating global aviation markets, George's strategic oversight ensures MAJESTIC P.L.T. is built on a foundation of operational excellence, risk mitigation, and long-term scalability. His presence signals institutional credibility and positions the program for high-level partnerships and global reach.

Board of Directors Overview

MAJESTIC P.L.T. is backed by a distinguished Board of Directors whose collective influence spans government, defense, international trade, and large-scale logistics. With a Former U.S. Secretary of Transportation providing policy insight and infrastructure strategy, and a U.S. Air Force Lieutenant General contributing high-level operational and security expertise, the board ensures MAJESTIC is built on a foundation of resilience and regulatory foresight. The Chairman of a leading

MAJESTIC P.L.T. PROGRAM

Flower Importer Association brings deep market intelligence and sourcing relationships, while the Vice President of Major Ground Logistics Operations offers tactical execution and distribution scale. Together, this board provides unmatched strategic guidance, unlocking access to global networks, public-private partnerships, and high-trust operational corridors essential for MAJESTIC P.L.T.'s success.

2. MARKET, INDUSTRY AND OPPRTUNITY ANALYSIS

2.1. Industry Landscape.

Global commerce is undergoing a period of profound disruption. Supply chains, once optimized for cost and scale, are now strained by rising tariffs, fragmented trade agreements, and escalating demands for transparency, traceability, and resilience. According to the Bureau of Economic Analysis, U.S. manufacturing output fell to 11.6% of GDP in 2022, down from 16% in 1990, reflecting a long-term erosion of domestic production capacity¹. This decline has exposed vulnerabilities in critical sectors such as food systems, logistics infrastructure, and industrial input, especially as geopolitical tensions and climate-related disruptions continue to reshape global sourcing strategies.

At the same time, businesses face mounting pressure to localize operations, reduce carbon footprints, and build adaptive supply networks that can withstand volatility. The traditional model of centralized production and long-haul distribution is no longer sufficient. Instead, the future demands modular, tech-enabled ecosystems that can respond dynamically to shifting market conditions, regulatory landscapes, and consumer expectations.

McKinsey's latest global survey reveals that **22% of senior executives now rank supply chain disruption as their top business concern**, the highest level since the pandemic-era peak in 2022. This shift reflects growing anxiety over geopolitical instability, climate-related events, and the fragility of overextended global sourcing models².

Key findings include:

- **Resilience over cost:** Companies are increasingly prioritizing supply chain resilience, even at the expense of short-term cost savings.
- **Regionalization trend:** Over **40% of surveyed firms** are actively restructuring their supply chains to favor nearshoring and regional hubs, especially in Latin America and Southeast Asia.

¹ Bureau of Economic Analysis, "Value Added by Industry," 2022

² McKinsey & Company. Economic Conditions Outlook, September 2025: Trade Policy and Supply Chain Risks Rise to the Fore. Retrieved from <https://www.mckinsey.com/capabilities/strategy-and-corporate-finance/our-insights/economic-conditions-outlook>

MAJESTIC P.L.T. PROGRAM

- **Technology adoption:** More than **60% of respondents** are investing in predictive analytics, digital twins, and AI-powered logistics to improve visibility and responsiveness.
- **Talent gaps:** Labor shortages in logistics and manufacturing are compounding delays and increasing operational risk, prompting firms to invest in workforce development and automation.

The erosion of U.S. manufacturing capacity is no longer just a domestic issue, it's a strategic vulnerability. As global commerce shifts toward resilience and adaptability, the United States finds itself constrained by aging infrastructure, high labor costs, and a fragmented industrial base. According to the National Association of Manufacturers, over 78% of U.S. manufacturers report difficulty finding skilled labor, while the average cost of domestic production has risen 12.4% since 2020, driven by energy volatility, compliance burdens, and supply chain fragmentation³.

This decline has created dependencies that ripple across sectors. The U.S. now imports over 70% of its critical agricultural inputs, including fertilizers, packaging materials, and perishables processing equipment⁴. Industrial components, once fabricated domestically, are increasingly sourced from distant markets, many of which are subject to tariff escalation or geopolitical instability. The result is a fragile system: one that struggles to respond to shocks, scale with demand, or support national economic goals.

Logistics Industry in 2025.

The global logistics industry in 2025 is navigating one of its most volatile and transformative periods in decades. Once optimized for cost and scale, supply chains are now being reengineered for resilience, responsiveness, and regional control. The convergence of geopolitical instability, climate disruptions, labor shortages, and fragmented infrastructure has exposed deep vulnerabilities in traditional logistics models.

⁴ U.S. Department of Agriculture, Economic Research Service & Foreign Agricultural Service. Outlook for U.S. Agricultural Trade: August 2025 (AES-133). Retrieved from USDA's official report

MAJESTIC P.L.T. PROGRAM

According to Yourco's 2025 Logistics Challenge Report⁵, over 43% of companies still lack real-time tracking capabilities across multimodal systems, especially when transitioning between sea, air, and ground transport. This lack of visibility leads to cascading delays, inventory losses, and eroded customer trust. Urban congestion, rising fuel prices, and disconnected tech platforms further compound the problem, making logistics execution increasingly unpredictable.

Key Challenges Facing the Logistics Sector:

Fragmentation Across Modes:

Most logistics networks remain siloed, air, sea, and ground systems operate independently, with limited data exchange or route optimization. This fragmentation leads to inefficiencies, missed handoffs, and inflated costs. Integrated systems are rare, and where they exist, they're often proprietary and closed loop.

External Disruptions

From extreme weather to political unrest, supply chains are frequently disrupted. The chip shortage of 2022 and port congestion in 2023 revealed how single-point dependencies can freeze entire industries. In 2025, companies are investing in predictive risk models that map vulnerabilities and suggest alternate routings before disruptions escalate.

Labor Shortages

The U.S. logistics sector faces a persistent talent gap. According to the American Trucking Associations, the industry is short over 80,000 drivers⁶, while warehouse labor turnover exceeds 35% annually. This instability drives up costs and reduces throughput.

Sustainability Pressures

⁵ Cain, Robert. Top 11 Challenges in the Logistics Industry and How to Solve Them in 2025. Yourco, May 26, 2025. Retrieved from Yourco's official blog

⁶ American Trucking Associations. Truck Driver Shortage Statistics: Trends to Know for 2025. FinditParts, January 23, 2025. Retrieved from FinditParts blog

MAJESTIC P.L.T. PROGRAM

ESG mandates and carbon tracking regulations are forcing companies to rethink their transport strategies. Hybrid fleets, LNG-powered vessels, and electric delivery vehicles are gaining traction, but adoption remains uneven.

Technology Integration Gaps

While AI, IoT, and robotics are transforming logistics, many firms struggle to integrate these tools across legacy systems. Only 60% of surveyed companies have adopted predictive analytics or digital twins for route planning and inventory control⁷.

Integrated Systems: Status and Strategic Potential

Fully integrated ground-sea-air logistics systems remain rare in 2025. Most global players operate segmented networks with limited interoperability. However, Amazon Logistics stands out as a benchmark for vertical integration:

Amazon's Model: Amazon controls its own air cargo fleet (Amazon Air), operates thousands of last-mile delivery vans, and manages fulfillment centers with robotic automation. It uses proprietary AI to optimize routes, predict demand, and reroute packages in real time.

Success Metrics: Amazon delivers over 72% of its U.S. packages in-house, up from 46% in 2020, and maintains an average delivery time of 1.9 days for Prime orders⁸. Its logistics cost exceeds \$100 billion annually, but its control over the supply chain has become a strategic advantage⁹.

Other players like DHL, Maersk, and FedEx are investing in multimodal integration, but few match Amazon's end-to-end control. Most rely on partnerships and third-party platforms, which introduce latency and reduce flexibility.

⁹ Logistics Viewpoints. 2025 Update: Amazon's Supply Chain Keeps Rewriting the Playbook. September 10, 2025.

Technology Trends in Production & Logistics.

In 2025, the convergence of advanced technologies, AI, IoT, robotics, and digital twins, is redefining how production and logistics systems operate. These innovations promise greater efficiency, adaptability, and resilience, but their implementation across industries remains uneven and fragmented.

Adoption Trends Across Production and Logistics.^{10,11}

- **AI & Machine Learning:** AI is increasingly used for demand forecasting, route optimization, and predictive maintenance. In manufacturing, ML models help fine-tune production schedules and reduce waste. In logistics, AI powers dynamic routing and real-time inventory tracking.
- **Digital Twins:** These virtual replicas of physical systems are gaining traction in both sectors. In logistics, they simulate warehouse operations and transport flows; in manufacturing, they model production lines to test changes before physical deployment.
- **IoT & Sensor Networks:** IoT devices are embedded across supply chains, from smart pallets to temperature-controlled containers, enabling granular visibility. In production, sensors monitor equipment health and environmental conditions to prevent downtime.
- **Automation & Robotics:** Collaborative robots (cobots) are now common in smart factories, handling repetitive tasks and enhancing precision. Logistics firms deploy autonomous vehicles and robotic picking systems to accelerate fulfillment.
- **Cloud Infrastructure & Edge Computing:** Cloud platforms support centralized data analysis, while edge computing enables real-time decision-making at the source, critical for time-sensitive logistics and decentralized production environments.

Implementation Challenges

Despite the promise, integration remains a major hurdle:

¹⁰ Future Today Strategy Group. 2025 Tech Trends Report: Supply Chain, Logistics & Manufacturing – 18th Edition. March 2025.

¹¹ Bertling Logistics. Trends in Transportation and Logistics 2025. July 22, 2025.

MAJESTIC P.L.T. PROGRAM

- **Legacy Systems:** Many manufacturers and logistics providers still rely on outdated ERP (Enterprise Resource Planning) and WMS (Warehouse Management System) platforms that lack interoperability with modern tools.
- **Fragmented Initiatives:** Technology adoption is often siloed AI for routing, IoT for tracking, robotics for fulfillment without a unified architecture. This leads to inefficiencies and data blind spots.
- **Cybersecurity Risks:** Increased digitization exposes systems to cyber threats. Logistics firms face vulnerabilities in fleet tracking and warehouse automation, while manufacturers risk IP theft and operational sabotage.
- **Talent Shortages:** Skilled labor capable of managing AI systems, robotics, and data analytics is in short supply. Companies struggle to recruit and retain tech-savvy operators and integrators.
- **Cost Barriers:** High upfront investment in automation, sensors, and cloud infrastructure deters smaller firms, especially in emerging markets. ROI timelines remain uncertain for many mid-tier operators.

Tech Leaders and Industry Alignment

Major tech firms are driving innovation, but often in isolation from broader industry ecosystems:¹²

- **Amazon:** Leads logistics automation with proprietary AI, robotics, and predictive systems. However, its model is vertically integrated and not easily replicable by others.
- **Siemens & Bosch:** Pioneers in industrial automation and digital twin technology, especially in smart manufacturing. Their platforms are widely adopted but often require deep customization.
- **Microsoft & Google Cloud:** Provide scalable cloud and AI infrastructure for logistics and production analytics. Yet, integration with legacy systems remains a challenge for many clients.
- **Startups & Niche Platforms:** Innovators in last-mile delivery, warehouse robotics, and ESG tracking are emerging rapidly, but their solutions often solve isolated problems without systemic integration.

¹² Across Logistics. Logistics Trends 2025: Technologies, AI, Challenges and Opportunities. June 9, 2025.

MAJESTIC P.L.T. PROGRAM

In sum, while technology is reshaping production and logistics, the journey toward unified, adaptive systems is still underway. The landscape is marked by innovation, but also fragmentation, risk, and uneven access. Bridging these gaps will require not just tools, but strategic coordination across industries and regions.

2.2. Majestic Program Opportunities analysis.

The global landscape of production and logistics in 2025 is defined by volatility and profound transformation. Traditional models, once optimized for cost and scale, now reveal vulnerabilities, fragmented supply chains, labor shortages, and mounting pressures for sustainability and resilience. For the United States, these trends have resulted in a diminishing domestic manufacturing base and an overreliance on distant, often politically unstable, sources for critical inputs. The erosion of manufacturing and logistics infrastructure is not merely an economic challenge; it is a strategic imperative, impacting everything from food security to industrial competitiveness and national resilience.

Within this context, the MAJESTIC P.L.T. program emerges as a groundbreaking solution, seizing an enormous opportunity to redefine how the United States and its allies build, move, and secure goods. MAJESTIC is architected to directly confront these systemic weaknesses through a bold strategy of vertical integration, regional collaboration, and high-tech innovation. It is designed not only to patch gaps, but to catalyze a new era of industrial renewal, reinforcing the U.S. trade balance and forging robust supply chain partnerships with trusted neighbors.

The disruptions of recent years have exposed the fragility of legacy supply chain systems. According to recent industry analyses, over 40% of global firms are shifting to nearshoring and regionalized production, with Latin America and key U.S. allies at the forefront. MAJESTIC leverages this historic pivot, integrating modular production hubs and predictive logistics across the Western Hemisphere. By tapping into the competitive labor markets and agricultural abundance of Mexico, Colombia, Brazil, and others, while aligning with their growing tech infrastructure, MAJESTIC unlocks new efficiencies and cost advantages that are both sustainable and resilient.

Strengthening the USA Trade Balance Through Ally-Supported Growth.

At the heart of MAJESTIC's architecture lies a commitment to supporting the U.S. trade balance. By investing in regional production nodes and interoperable logistics systems, MAJESTIC enables the export of high-value services, advanced tech

MAJESTIC P.L.T. PROGRAM

platforms, and logistics expertise. This approach directly addresses the country's trade deficit, shifting reliance away from distant suppliers toward collaborative networks with established allies. The program's ally-shoring model, championed by the U.S. International Trade Administration, is uniquely suited to deepen economic ties, create mutual benefits, and ensure greater diplomatic alignment.

The MAJESTIC program's regional partnerships transform traditional trade relationships into engines of innovation. Rather than reshoring in isolation, MAJESTIC proposes a collaborative system that strengthens the economic fabric of the Americas, facilitating shared growth, resilient supply chains, and enhanced market access. These alliances don't just increase volume; they build trust and traction with diverse markets, reinforcing the United States' leadership in the post-globalization era.

The fragmentation of current logistics networks, where air, sea, and ground systems operate in silos, has long been a barrier to efficiency and control. MAJESTIC disrupts this paradigm by integrating these modes into a unified, modular system supported by cutting-edge technology. Inspired by the operational dominance of organizations like Amazon, MAJESTIC's vertical integration combines predictive analytics, automation, and AI-powered decision-making to optimize every stage of the supply chain.

This consolidation yields transformative benefits:

- **Enhanced Manufacturing Capacity:** MAJESTIC's network of production hubs, powered by advanced robotics, digital twins, and real-time analytics, boosts U.S. manufacturing capabilities, enabling rapid scaling and flexible adaptation to market shifts.
- **Strategic Risk Reduction:** By embedding redundancy and regional flexibility, MAJESTIC reduces dependency on single-point suppliers and distant markets. This mitigates vulnerability to geopolitical disruptions, climate events, and labor shortages.
- **Efficient, High-Tech Logistics:** The integration of IoT sensors, cloud platforms, and smart automation accelerates delivery, improves tracking, and lowers operational costs. Fully interoperable systems enable seamless movement of goods, increasing visibility and reducing latency across the network.

Supporting traditional Allies and Building Regional Resilience

MAJESTIC's vision is not solely an American story; it is a hemispheric blueprint for shared prosperity. By connecting U.S. capabilities with allied nations' strengths, the

MAJESTIC P.L.T. PROGRAM

program fosters regional self-sufficiency and resilience. Investments in workforce development, tech infrastructure, and cross-sector partnerships elevate the region's competitive standing, while collaborative sourcing and shared innovation platforms ensure that supply chains remain adaptive and secure.

These partnerships are foundational to the program's success. They enable the U.S. to export technological expertise and advanced logistics services, while importing agricultural inputs and manufactured goods with lower tariffs and higher traceability. This dynamic not only enhances domestic capacity but also strengthens diplomatic and economic ties, fortifying the United States position as the leader in resilient production and logistics.

MAJESTIC P.L.T. stands as a catalyst for transformative change in the way the United States and its allies produce, move, and secure goods. Through vertical integration, regional alliances, and technology-driven innovation, MAJESTIC offers a strategic pathway to restore manufacturing prowess, reinforce the trade balance, and build the most efficient, resilient supply system in the world. In an era marked by uncertainty and disruption, MAJESTIC P.L.T. is not just filling a gap, it is redefining the foundation of economic leadership for generations to come.

3. MAJESTIC Standard Risk Management Process

A Unified Framework for Resilience, Control, and Strategic Response

In the MAJESTIC P.L.T. ecosystem, risk is not treated as a reactive burden, it is modeled, quantified, and strategically neutralized. Every project, corridor, and operational module within the platform adheres to a standardized risk management process that ensures continuity, investor confidence, and long-term sustainability.

This methodology is designed to be modular, scalable, and data-driven aligning with MAJESTIC's core principles of operational clarity, founder empowerment, and hemispheric control.

3.1. Methodology Overview: Quantifying Risk, Structuring Response

Each risk is evaluated across two primary dimensions:

Influence Assessment

- **O.P. (Operational Probability):** Likelihood of the risk occurring within the operational context.
- **P.I. (Project Impact):** Degree to which the risk affects market access, buyer behavior, or trade flow.

Each dimension is rated on a 5-point scale:

- **VL (Very Low) = 1**
- **L (Low) = 2**
- **M (Medium) = 3**
- **H (High) = 4**
- **VH (Very High) = 5**

A **specific average (ESP)** is calculated for each risk, and a **general average (GRAL)** is derived from the category (e.g., market, logistics, digital security).

Management Mechanism Evaluation

Each risk is matched with a mitigation strategy, evaluated across:

Capability: The platform's ability to implement the strategy

- Rated VL to VH (1 to 5)

Cost: Investment required to deploy the mechanism

MAJESTIC P.L.T. PROGRAM

- Inverted scale: VL = 5 (high cost), VH = 1 (low cost)

The **management ESP** is the average of capability and cost. This is then compared to the risk ESP:

- If **management ESP > risk ESP**, the risk is considered **controlled**.
- If **management ESP < risk ESP**, additional strategies must be deployed.

A final **control index** is calculated:

Management GRAL – Risk GRAL = Net Control Value

Positive = Controlled environment

Negative = High-risk exposure requiring intervention

Application Across MAJESTIC Projects

This methodology is embedded into every MAJESTIC initiative, from FRESH-24's corridor operations to future platform modules. It ensures that each project:

- **Identifies risks early**, using structured diagnostics and stakeholder input.
- **Quantifies exposure**, enabling investor-grade transparency and prioritization.
- **Aligns mitigation strategies** with operational capacity and financial logic.
- **Monitors performance**, using real-time dashboards and KPI-linked alerts.
- **Adapts dynamically**, refining strategies as corridor conditions evolve.

Each operational unit maintains its own risk matrix, but shares common services for legal advisory, ESG compliance, and simulation modeling, ensuring both autonomy and strategic cohesion.

Example Categories Applied

- **Market Risks:** Seasonal demand volatility, niche dependency, buyer concentration.
- **Logistics Risks:** Route disruption, cold-chain failure, customs bottlenecks.
- **Regulatory Risks:** Trade agreement shifts, ESG compliance tightening.
- **Digital Risks:** Cyberattacks, data breaches, platform adoption resistance.
- **Team Risks:** Talent availability, regional fluency, operational discipline.

Each risk is mapped, valued, and tracked using the MAJESTIC matrix, ensuring that no corridor or module operates blindly. This process transforms uncertainty into structured response.

MAJESTIC P.L.T. PROGRAM

Strategic Impact

The MAJESTIC Risk Management Process is more than a safeguard, it's a strategic asset. It enables:

- **Investor confidence** through quantifiable control.
- **Operational resilience** across volatile regions.
- **Scalable governance** that adapts to corridor complexity.
- **Founder empowerment**, allowing proactive decision-making at every level.

4. FRESH-24 project. Strategic Production & Trade Engine of the MAJESTIC Platform

4.1. Project summary:

FRESH-24 is the production and trade pillar of the MAJESTIC P.L.T. initiative, designed to unlock competitive, high-efficiency manufacturing and agricultural output across the Americas. Its mission is to deliver premium-quality goods at globally competitive prices, enabling entry into high-barrier markets and sustained profitability in sectors where U.S. and LATAM producers have been historically underrepresented.

FRESH-24 leverages the industrial depth of the United States, the year-round agricultural productivity of Latin America, and the current trade imbalance to architect a hemispheric supply chain that is diversified, sustainable, and modular. From perishables to precision components, the system is designed to deliver everything from a pencil to a rocket anchored in regional strength and global relevance.

By focusing initially on high-margin niche markets such as cut flowers, specialty produce, and perishables, FRESH-24 builds operational expertise, infrastructure, and brand equity. These sectors serve as launch pads for broader trade expansion into industrial goods, packaging, and value-added exports, creating a flywheel of production, logistics, and reinvestment.

At its core, FRESH-24 introduces a “Circular Trade System”, a dynamic model where exports and imports are continuously balanced across quality, pricing, and revenue. This system:

- Reduces dependency on single-source inputs
- Enhances trade resilience and currency stability
- Enables adaptive routing and inventory control

FRESH-24 is not just a production engine, it's a data-driven ecosystem. Integrated with MAJESTIC's simulation and orchestration layer, it uses:

- Predictive analytics for crop yield and demand
- Digital twins for facility optimization
- AI-powered pricing and routing models
- ERP/WMS integration for real-time visibility

MAJESTIC P.L.T. PROGRAM

FRESH-24 is engineered to generate rapid, high-margin cash cycles by targeting specialty exports and perishables sectors known for fast turnover and premium pricing. Its modular infrastructure is designed for seamless replication across Latin America, enabling scalable deployment with minimal friction and maximum regional impact. Strategically aligned with U.S. nearshoring and food security priorities, the project offers a timely solution to rising import dependency and supply chain fragility.

The FRESH-24 production engine is built on a dynamic, intelligence-first framework that transforms market signals into profitable, scalable output. At its core is a permanent market intelligence system, a continuously updated data layer that monitors global demand shifts, pricing trends, regulatory changes, and logistics bottlenecks across key sectors. This system doesn't just react, it anticipates. It identifies high-velocity market opportunities in real time, from seasonal produce gaps in North America to emerging specialty demand in Europe or Asia.

Once a market opportunity is flagged, FRESH-24 activates its product solution engine, a modular decision layer that matches opportunity with viable production inputs. This includes crop selection, packaging formats, processing requirements, and compliance pathways. Whether it's a high-margin floral export, a temperature-sensitive fruit, or a precision-packaged component, the system aligns product design with market entry logic, ensuring speed, quality, and profitability.

The final layer is deep integration across manufacturing, logistics, and delivery orchestration. FRESH-24 facilities are designed for modular throughput, enabling rapid reconfiguration based on demand. ERP and WMS systems synchronize production with inventory and routing, while digital twins simulate performance and optimize resource allocation. Logistics corridors, air, sea, and ground are embedded into the planning process, ensuring that delivery is not just fast, but cost-efficient and strategically leveraged.

This closed-loop system allows FRESH-24 to maintain competitiveness while continuously unlocking new opportunities. Every shipment feeds back into the intelligence layer, refining forecasts and enhancing future decisions. It's not just a supply chain, it's a learning, evolving production ecosystem built for speed, precision, and hemispheric scale.

4.2. Project problem statement and objectives.

FRESH-24 addresses the systemic disconnect between market demand, regional production capacity, and logistics execution. Today, producers across the U.S. and Latin America face three critical barriers:

- Lack of real-time market intelligence to identify and act on emerging demand.
- Fragmented production systems that cannot adapt quickly to shifting opportunities
- Disjointed logistics networks that erode competitiveness through delays, spoilage, and cost overruns

These gaps result in missed revenue, underutilized regional assets, and continued dependence on distant, volatile supply chains. FRESH-24 solves this by creating a circular, data-driven trade system that continuously balances exports and imports leveraging quality, speed, and price to build a resilient, profitable production ecosystem.

4.3. Fresh-24 Main Objective.

FRESH-24 aims to establish a hemispheric production and trade engine that delivers high-quality, competitively priced goods, especially perishables and specialty exports through a modular, intelligence-driven supply chain. Its core mission is to unlock profitable access to high-barrier markets by integrating advanced market analytics, adaptive manufacturing, and synchronized logistics across the Americas.

4.4. FRESH-24 market opportunity.

FRESH-24 is strategically positioned to capitalize on high-value, under-optimized trade flows between the United States, Colombia, and the Caribbean islands. These regions represent a dynamic triangle of production capacity, consumer demand, and logistical proximity yet they remain fragmented by outdated infrastructure, reactive supply chains, and limited integration. By embedding predictive intelligence, modular production, and synchronized logistics into a single operational framework, FRESH-24 unlocks a new class of trade: fast-moving, premium, and circular.

MAJESTIC P.L.T. PROGRAM

Colombia is the world's second-largest flower exporter and the dominant supplier to the United States, accounting for over 60% of U.S. flower imports¹³. In 2024 alone, Colombian flower exports to the U.S. exceeded \$1.24 billion¹⁴, with roses contributing more than \$1 billion up from \$433 million just a decade earlier¹⁵. Despite this growth, the trade remains vulnerable to spoilage, seasonal bottlenecks, and fragmented routing. U.S. domestic flower production, valued at just \$350 million, has stagnated, leaving a widening gap between demand and local supply¹⁶.

FRESH-24 addresses this by integrating Colombian floriculture into MAJESTIC's cold-chain corridors, enabling faster, fresher, and more cost-efficient delivery to high-margin markets. Through predictive demand modeling and digital twin simulation, the platform can optimize routing around peak events like Valentine's Day and Mother's Day, while reducing waste and enhancing shelf-life. This not only improves profitability but also positions FRESH-24 as a strategic logistics partner for Colombia's \$2.1 billion floriculture sector, projected to grow to \$2.65 billion by 2030¹⁷.

The Caribbean islands import between 60% and 80% of their food, with a regional food import bill exceeding \$13.76 billion¹⁸. The United States holds a dominant 53% market share in consumer-oriented exports to the region, including fresh produce, dairy, and processed foods¹⁹. Colombia, meanwhile, is expanding its agricultural exports to the Caribbean, particularly in tropical fruits, avocados, limes, and vegetables. Trade data from 2024 shows rising CIF values for Colombian produce shipped to Dutch Caribbean islands such as Aruba, Curaçao, and Bonaire, with roses, limes, and perishables among the top categories.

FRESH-24 leverages this dual-market dynamic by consolidating U.S. and Colombian produce into mixed-load shipments, routed through MAJESTIC's multimodal corridors. By using real-time market intelligence and adaptive inventory systems, the

¹⁹ USDA Foreign Agricultural Service, Caribbean Basin: Exporter Guide Annual, Global Agricultural Information Network (GAIN), July 3, 2024, accessed September 11, 2025

MAJESTIC P.L.T. PROGRAM

platform can respond to seasonal demand shifts and reduce spoilage, unlocking higher margins and faster turnover. This positions FRESH-24 as a hemispheric food logistics engine, capable of serving both premium retail and institutional buyers across the Caribbean Basin.

While Colombia exports flowers, coffee, and produce to the U.S., the reverse trade flow is equally robust. In 2024, U.S. exports to Colombia totaled \$19.04 billion, led by industrial machinery (\$1.73B), pharmaceuticals (\$594M), processed foods (\$409M), and aerospace components (\$418M). These categories offer strategic opportunities for FRESH-24 to balance trade flows and maximize corridor utilization. By embedding return logistics into its routing logic, the platform can deliver high-value U.S. goods into Colombian markets, reducing empty backhauls and enhancing capital efficiency²⁰.

This circular trade model where exports and imports are continuously balanced across quality, price, and logistics creates a flywheel effect that compounds profitability and resilience. It also aligns with MAJESTIC's broader infrastructure strategy, reinforcing regional economic integration and reducing dependency on distant, volatile supply chains.

The Caribbean's seafood sector presents a high potential but underdeveloped export opportunity. CARICOM nations exported \$295 million in fish and seafood in 2024, while importing \$387 million highlighting a net deficit and limited intraregional trade (only 20%)²¹. Meanwhile, the U.S. seafood market is valued at \$400 billion, with rising demand for traceable, sustainably sourced fresh fish²². CARICOM's "Vision 25 by 2025" initiative aims to reduce food imports by 25%, creating incentives for regional aquaculture and capture fisheries²³.

FRESH-24 can serve as a cold-chain integrator for Caribbean seafood exports to the U.S., particularly in high-demand categories like fresh tuna, snapper, and shellfish. By embedding traceability and tech into its logistics layer, the platform can access

²³ Caribbean Regional Fisheries Mechanism (CRFM), "Vision 25 by 2025 CARICOM Initiative," *CRFM Communications*, published July 5, 2024

MAJESTIC P.L.T. PROGRAM

premium buyers and institutional contracts while supporting regional development and food sovereignty.

Together, these corridors form the backbone of FRESH-24's market opportunity. By consolidating fragmented trade flows into a unified, intelligence-driven system, the platform delivers not just goods but strategic value. It enables producers to reach premium markets, buyers to access fresher and more diverse inventory, and investors to participate in a scalable, and resilient. In a world defined by volatility and fragmentation, FRESH-24 offers clarity, control, and compounding returns.

4.5. Product & Service Offering

FRESH-24 is not a conventional aggregator or distributor, it is a hemispheric production and trade engine designed to collapse inefficiencies, unlock premium market access, and create shared value across every node of the supply chain. At the heart of its offering is a modular system of captive and associated production nodes, strategically deployed across the Americas. These nodes are not simply suppliers, they are logic-level partners, embedded into the platform's intelligence layer and incentivized through shared revenue, predictive demand, and operational support.

Rather than purchasing directly from farmers or growers on a transactional basis, FRESH-24 establishes cooperative production relationships that align incentives, reduce volatility, and increase profitability for both parties. By integrating growers into the platform's planning and forecasting systems, FRESH-24 ensures consistent product availability, reduces waste, and mitigates production risk. This model transforms fragmented supply into a synchronized network, one that can respond to market signals in real time and scale across regions with minimal friction.

These production partnerships are developed in close collaboration with local governments and agricultural agencies in the United States, Colombia, and across the Caribbean Basin. Through joint programs focused on quality standards, traceability, and ESG compliance, FRESH-24 ensures that every product meets the expectations of premium buyers whether institutional, retail, or e-commerce. These partnerships also unlock access to public infrastructure, training programs, and certification pathways, further reducing onboarding costs and accelerating deployment.

MAJESTIC P.L.T. PROGRAM

The platform's core value proposition lies in its ability to reduce intermediation. Traditional agricultural trade is burdened by layers of brokers, consolidators, and speculative handlers, each adding cost, complexity, and opacity. FRESH-24 collapses this structure by creating a direct connection between producers and buyers, facilitated through MAJESTIC's projected technology stack. This includes:

- A real-time trade interface for institutional buyers and retailers
- A product auction engine for high-demand or seasonal goods
- An e-commerce layer for direct-to-consumer and specialty channels
- A traceability dashboard for ESG metrics, origin data, and compliance

This digital infrastructure not only shortens the distance between farm and market it transforms the nature of the transaction. Products are no longer static goods, they become data-rich, tradable assets. As the platform scales, FRESH-24 will introduce mechanisms to commoditize select product categories, enabling growers and buyers to engage in futures contracts, dynamic pricing models, and inventory hedging. This unlocks new forms of liquidity and financial planning, while preserving competitiveness through real-time market alignment.

By embedding intelligence, transparency, and modularity into every layer of its product and service offering, FRESH-24 delivers more than logistics, it delivers strategic control. Growers gain visibility and stability. Buyers gain speed and quality. Investors gain access to a scalable, resilient, and future-proof trade engine that evolves with the market and compounds in value.

FRESH-24's hemispheric trade model begins with a high-leverage exchange between the United States and Colombia, designed to activate circular value creation across both production and logistics. On the U.S. side, the platform will prioritize exports of **meats, agricultural technology, and farming inputs**, including fertilizers, pesticides, and precision tools. These categories represent over **\$20 billion in annual U.S. exports**, with Colombia already among the top growth markets²⁴.

To optimize sourcing and reduce acquisition costs, FRESH-24 will deploy **AI-driven supplier mapping**, identifying independent farmers, cooperatives, and input manufacturers across the U.S. with excess capacity or strategic alignment. This system will match Colombian growers with U.S. suppliers based on product needs,

²⁴ USDA Foreign Agricultural Service, US Agricultural Exports to Colombia Reached Record High in 2024, Report Number CO2025-0004, published February 20, 2025

MAJESTIC P.L.T. PROGRAM

logistics feasibility, and ESG compliance creating a dynamic sourcing engine that evolves with market conditions.

The strategy directly addresses the cost advantage held by Chinese suppliers in agricultural inputs. By embedding trade reciprocity **“we buy flowers from you, you buy materials from us,”** FRESH-24 creates a circular economy model that can reduce production costs by up to **20%**, according to internal simulations and input price benchmarks. This model is not only economically efficient, but also politically aligned, with support from **local Governments and agricultural Ministries** in both countries to ensure quality standards, traceability, and regulatory compliance.

From Colombia, the initial export focus will be on **floriculture**, a \$2.35 billion industry growing at 13% annually. FRESH-24 will not operate as a passive wholesaler, but as a **full-chain integrator** embedding itself in production planning, quality control, packaging, and logistics. By leveraging MAJESTIC’s projected infrastructure corridors and cold-chain systems, Colombian flowers will reach U.S. buyers faster, fresher, and at lower cost, unlocking premium retail and institutional markets.

FRESH-24’s expansion into the Caribbean is not limited to high-end hospitality, it’s a hemispheric strategy to transform food access, trade balance, and supply chain resilience across the region. With established agreements in the hotel, leisure, and cruise sectors, the platform is already positioned to serve premium buyers demanding traceable, high-quality goods. But the deeper opportunity lies in reaching the entire island population, where food insecurity and import dependency remain critical challenges.

As of 2024, Caribbean nations import between 60% and 80% of their total food supply²⁵, with some islands like Barbados and Montserrat relying on imports for over 85% of grocery staples²⁶. The regional food import bill peaked at \$13.76 billion, driven by rising costs in meats, cereals, and perishables. In Suriname, for example, food prices rose by 30% following global disruptions²⁷, and in Trinidad & Tobago, food accounts for 17.3% of the consumer price index²⁸, underscoring its economic weight.

²⁵ World Food Programme & CARICOM, Caribbean Food Security & Livelihoods Survey – Regional Summary Report, April 2024

²⁸ Trinidad and Tobago Central Statistical Office, Consumer Price Index – July 2024, published in Gazette No. 124 Vol. 63, August 28, 2024

MAJESTIC P.L.T. PROGRAM

FRESH-24 addresses this vulnerability by integrating U.S. and Colombian exports into a unified supply chain tailored for Caribbean needs. From the U.S., the platform will deliver meats, cereals, processed foods, and agricultural inputs products already proven in regional trade but now optimized through MAJESTIC's logistics corridors and AI-driven demand forecasting. From Colombia and Latin America, the focus will be on flowers, tropical produce, and specialty goods, with full-chain integration from farm to shelf.

Unlike traditional exporters, FRESH-24 collapses intermediation. Its model connects growers and manufacturers directly to buyers whether cruise lines, hotels, or island supermarkets via MAJESTIC's projected trade platform, which includes real-time inventory, product auctions, and ESG dashboards. This shortens delivery times, reduces spoilage, and lowers costs by making premium products accessible to broader populations.

By embedding circular trade logic where Caribbean buyers source goods from the U.S. and Colombia, and regional producers gain access to export channels, FRESH-24 creates a compounding ecosystem. It supports CARICOM's "25 by 2025" initiative to reduce food imports by 25%, while unlocking new revenue for producers and stabilizing prices for consumers.

4.6. Production & Infrastructure Model

4.6.1. FILPROC: Fully Integrated Production and Logistic Corridors

At the core of MAJESTIC's hemispheric strategy lies a transformative operational framework: FILPROC, or Fully Integrated Production and Logistic Corridors. FILPROC is not just a supply chain, it's a synchronized ecosystem that fuses production, logistics, and technology into a single, intelligent infrastructure. It is designed to power FRESH-24 and other platform modules with unmatched speed, traceability, and scalability across the Americas and beyond.

FILPROC corridors are built on three interlocking pillars:

Production Model Integration:

Rather than relying on fragmented sourcing or transactional procurement, FILPROC embeds captive and associated production nodes directly into the corridor logic. These nodes whether farms, fisheries, or manufacturing hubs, are mapped, onboarded, and managed through MAJESTIC's intelligence layer. This

MAJESTIC P.L.T. PROGRAM

allows real-time coordination of supply, predictive demand modeling, and synchronized harvest-to-market cycles. Producers are not vendors, they are strategic partners, integrated at the logic level and incentivized through shared revenue, demand visibility, and operational support.

Logistics Synchronization

FILPROC corridors are designed to collapse latency and reduce friction. They integrate cold-chain systems, multimodal transport, bonded warehousing, and customs pre-clearance into a unified routing logic. Each corridor is optimized for product type, destination market, and ESG compliance. Whether moving fresh flowers from Bogotá to Miami or seafood from Kingston to New York, FILPROC ensures that every shipment is tracked, timed, and quality-assured. The corridors are modular, allowing rapid replication across new geographies and product categories.

Technology Backbone

FILPROC is powered by MAJESTIC's in-house developed technology stack, which includes:

- AI-driven production mapping and supplier onboarding
- Real-time logistics orchestration and route optimization
- Trade interface for buyers, including auctions, e-commerce, and institutional procurement.
- ESG and traceability dashboards for compliance and impact metrics
- Simulation engines to model corridor performance, cost reduction, and market responsiveness

This technology doesn't just support operations, it transforms them. It enables FILPROC to evolve dynamically, respond to market shifts, and compound efficiency across every transaction.

By embedding intelligence into every layer "from soil to shelf," FILPROC delivers more than logistics. It delivers strategic control, cost reduction, and market agility. It is the backbone of MAJESTIC's continental and global ambitions, and the foundation upon which FRESH-24 will scale across the Caribbean, Latin America, and beyond.

MAJESTIC P.L.T. PROGRAM

4.6.2. Consolidation and distribution centers.

FILPROC corridors are not theoretical they are anchored in a network of **strategically located, state-of-the-art hubs** designed to consolidate regional production, optimize logistics, and deliver consistent quality across hemispheric trade routes. Each hub is tailored to the product mix, market access, and operational logic of its region, forming a synchronized infrastructure spine for MAJESTIC's continental and global ambitions.

United States Hubs

- **Greensboro International Airport (North Carolina)** will serve as the **primary consolidation and distribution hub** for FRESH-24's U.S. operations. Its central location, multimodal connectivity, and customs infrastructure make it ideal for aggregating meats, agricultural inputs, and processed goods destined for Latin America and the Caribbean.
- **Lakeland, Florida**, positioned near Miami's flower import corridor, will specialize in **floriculture logistics**, including cold-chain handling, packaging, and auction-based distribution.
- **Gettysburg, Pennsylvania**, will evolve into a **mid-Atlantic logistics node**, supporting institutional buyers and regional redistribution.
- Planned expansions to the **West Coast** and **Alaska** will support Pacific trade flows, seafood logistics, and resilience against seasonal disruptions.

Latin America & Caribbean Hubs

- In **Colombia**, **Rionegro (Medellín)** and **Cali's international airport** will anchor floriculture and specialty produce exports. These hubs will integrate directly with Lakeland and Greensboro, forming a **bi-directional FILPROC corridor** for both goods and agricultural inputs.
- **El Salvador** will serve as a **Central American logistics pivot**, consolidating regional production and enabling access to both North and South American markets.
- In the Caribbean, **Puerto Rico** and the **Dominican Republic** will operate as **island consolidation hubs**, aggregating products from smaller nations and redistributing U.S. and Colombian exports. These hubs will also support cold-chain infrastructure for seafood, perishables, and high-value goods.

MAJESTIC P.L.T. PROGRAM

Each FILPROC facility will be equipped with:

- **Cold-chain systems** for temperature-sensitive goods
- **Quality control labs** for grading, certification, and compliance
- **Bonded warehousing** and customs pre-clearance zones
- **AI-powered inventory and routing systems**
- **ESG traceability dashboards** for buyers and regulators
- **Auction and e-commerce integration** for dynamic pricing and direct sales.

This infrastructure doesn't just move goods, it **orchestrates trade**. It enables predictive planning, reduces spoilage, and ensures that every product whether a bouquet from Bogotá or a pallet of U.S. beef arrives fresh, certified, and market ready.

By localizing specialization and synchronizing operations across FILPROC corridors, MAJESTIC builds a resilient, scalable, and intelligence-driven trade engine, one that empowers producers, delights buyers, and redefines what hemispheric logistics can achieve.

4.7. Operations & Logistics

FRESH-24's operational model is designed to do more than move goods, it's engineered to anticipate demand, prevent disruption, and optimize every link in the supply chain. At its core is a dynamic system of predictive intelligence, simulation logic, and real-time responsiveness, all embedded within the FILPROC framework.

These corridors are not static routes they are living systems, constantly adapting to market signals, environmental conditions, and geopolitical shifts.

From the moment a product is harvested or manufactured, it enters a logic-driven chain that connects production nodes, logistics hubs, and final buyers through a shared intelligence layer. This system doesn't wait for problems to occur, it forecasts them. Using advanced simulation engines, FRESH-24 models inventory levels, transport routes, and buyer demand across multiple time horizons. It can simulate the impact of a port delay in Puerto Rico, a weather disruption in Rionegro, or a

MAJESTIC P.L.T. PROGRAM

regulatory shift in Florida and instantly recommend corrective actions. These simulations are not theoretical exercises; they are operational tools used daily to guide decisions, allocate resources, and maintain service continuity.

In the initial phases, FRESH-24 will strategically engage **regional logistics partners and certified operators** to reduce capital expenditure and mitigate risk. These partnerships allow the platform to scale quickly while maintaining control over quality, compliance, and data flows. Every operational decision from route selection to inventory allocation is made based on real-time data and historical performance. This commitment to **data-driven management** ensures that the system remains lean, responsive, and resilient, even in volatile conditions.

The FILPROC corridors are designed to be fully responsive. If a cold-chain alert is triggered in Cali, the system can reroute product to Rionegro, notify Lakeland of adjusted arrival times, and update buyer dashboards within seconds. This level of responsiveness is possible because every node in the corridor is connected through shared dashboards that provide visibility into inventory status, quality metrics, ESG compliance, and delivery timelines. Producers, logistics teams, and buyers operate from the same source of truth, enabling coordinated action and eliminating blind spots.

Artificial intelligence plays a vital role in this ecosystem not as a passive tool, but as an active management layer. It identifies bottlenecks before they impact delivery, recommends procurement adjustments based on buyer trends, and continuously learns from disruptions to improve future simulations. AI also supports ESG compliance by flagging risks and suggesting corrective actions, ensuring that every shipment meets the standards expected by institutional buyers and government partners.

This intelligence is not siloed, it's shared. Dashboards are accessible to all stakeholders, from growers to regulators, creating transparency and trust across the chain. Buyers can see where their products are, how they were handled, and when they will arrive. Producers can forecast demand and plan harvests with confidence. Logistics teams can optimize routes and warehouse utilization in real time.

FRESH-24's operations and logistics model are built to scale. It's modular, adaptive, and deeply integrated with MAJESTIC's broader infrastructure vision. As new

corridors come online from Alaska to El Salvador, from the West Coast to the Dominican Republic, the same intelligence layer will guide their deployment, ensuring consistency, efficiency, and strategic alignment.

4.8. Financial Projections

FRESH-24 is engineered as a profitable, multi-stream business with a financial model that balances operational efficiency, strategic monetization, and long-term sustainability. Rather than relying on a single margin or transactional flow, the platform generates revenue across a diversified set of channels, each designed to scale independently while reinforcing the others. This architecture not only protects against market volatility but also compounds in value as infrastructure, data, and trade volume grow.

4.8.1. Identified Revenue Streams:

Direct Product Sales

At the foundation of the model is the sale of high-quality, traceable goods, meats, floriculture, seafood, and agricultural inputs, sourced through captive and associated production nodes. These nodes are embedded in the FILPROC corridors, allowing synchronized planning, reduced spoilage, and optimized cold-chain handling. By collapsing intermediation and integrating logistics, FRESH-24 captures margin traditionally lost to brokers and speculative handlers. As volumes scale, the cost per unit drops, while quality and consistency rise, unlocking premium markets without sacrificing competitiveness.

Trading Facilitation Fees

FRESH-24's digital trade interface powered by MAJESTIC's proprietary technology, enables real-time auctions, institutional procurement, and e-commerce transactions. The platform earns facilitation fees on each trade, structured as percentage-based commissions or tiered access to premium features. These fees are low-friction and high-margin, and they scale naturally with transaction volume. As more buyers and sellers are on board, the network effect increases platform stickiness and revenue density.

MAJESTIC P.L.T. PROGRAM

Modular Infrastructure Services

Each FILPROC hub, Greensboro, Lakeland, Rionegro, and others, offers modular services including cold storage, bonded warehousing, packaging, quality control, and customs pre-clearance. These services are monetized independently, creating a flexible revenue layer that adapts to corridor specialization. For example, Lakeland may generate recurring income from floriculture packaging and auction services, while Rionegro monetizes cold-chain handling and ESG certification. These services also attract third-party users, turning infrastructure into a regional profit center.

Data & Intelligence Licensing

As the platform aggregates operational, market, and ESG data, it unlocks opportunities for monetization through analytics subscriptions and licensing agreements. Institutional buyers, regulators, and strategic partners can access predictive models, traceability reports, and corridor performance dashboards. This transforms operational data into a strategic asset, one that compounds in value as the platform scales.

4.8.2. Cost structure

In early phases, FRESH-24 will collaborate with logistics firms, government agencies, and regional cooperatives to reduce capital expenditure and accelerate deployment. These partnerships may include revenue-sharing agreements, co-branded infrastructure, or joint service offerings. This approach minimizes upfront risk while maintaining control over quality and data flows. As corridors mature, these partnerships evolve into long-term revenue contributors.

FRESH-24's cost structure is optimized through a combination of shared infrastructure, in-house technology development, and labor efficiency powered by AI. By leveraging existing logistics assets and strategic partnerships in the initial phases, the platform avoids heavy capital outlay while maintaining operational control. As proprietary systems come online, inventory forecasting, route optimization, ESG dashboards, the cost of coordination drops, and throughput increases.

MAJESTIC P.L.T. PROGRAM

Technology plays a central role in labor efficiency, but not through displacement. Instead, repetitive, dangerous, or exposure-prone tasks such as cold-chain monitoring, customs documentation, or manual grading are automated, allowing human workers to evolve into more specialized roles. These include:

- Corridor operations analysts
- ESG compliance managers
- AI system supervisors
- Trade interface coordinators
- Data quality and traceability auditors

This evolution not only preserves jobs, but it also upgrades them, creating a workforce that is more skilled, more resilient, and better aligned with the platform's intelligence-driven mission. Training programs will be developed in partnership with local governments and educational institutions to ensure that workers transition smoothly into these new roles.

For all involved, this means a business that is not only profitable but responsible, scalable, and future proof. FRESH-24 monetizes infrastructure, data, and trade with precision, while building a workforce and cost structure that compounds in efficiency without sacrificing impact. It's not just a logistics platform, it's a hemispheric engine for sustainable growth.

4.8.3. Tax strategy

FRESH-24 is structured to operate as a multi-jurisdictional entity, with a central incorporation in a U.S. state offering favorable regulatory clarity and international trade alignment such as Delaware or Florida, while establishing operational branches in key production and logistics markets across the Americas. This structure enables the platform to maintain a unified cashflow architecture, allowing capital to move efficiently between countries while respecting local tax laws and international compliance frameworks.

By strategically locating hubs in jurisdictions with bilateral trade agreements, tax incentives for export infrastructure, and streamlined customs regimes, FRESH-24 minimizes fiscal friction and maximizes reinvestment potential.

MAJESTIC P.L.T. PROGRAM

Each branch operates under a standardized financial protocol, ensuring transparency, auditability, and optimized intercompany transfers. This allows profits to be reinvested where growth is strongest, while maintaining centralized oversight and strategic control.

The model is designed to be profitable and compliant, leveraging legal tax optimization strategies (not avoidance) to ensure that every dollar deployed contributes to operational efficiency, infrastructure development, and long-term value creation. As the platform scales, this structure supports regional reinvestment, cross-border liquidity, and financial resilience, making FRESH-24 not only a logistics engine, but a financially intelligent enterprise.

4.8.4. Financial Strategy: Structured Profit Allocation for Sustainable Growth

FRESH-24's financial strategy is built on a disciplined, phased approach to profit allocation designed to ensure operational resilience, strategic reinvestment, and long-term scalability. Rather than pursuing short-term gains or speculative growth, the platform follows a four-scenario model that aligns financial performance with the broader MAJESTIC vision: building a hemispheric infrastructure engine that delivers clarity, control, and compounding value.

Self-Sufficiency: Covering Fixed Operational Costs

The first financial milestone is **self-sufficiency**, where profits are directed toward covering the platform's fixed operational costs, logistics, infrastructure leases, technology maintenance, and core staffing. This phase ensures that the business can sustain its day-to-day operations without relying on external capital or debt. Achieving self-sufficiency validates the model's viability and sets the foundation for disciplined growth. It also enables predictable cashflow management, allowing each corridor and hub to operate with autonomy and financial clarity.

Contingency: Building a Strategic Buffer

Once operational costs are consistently covered, the next scenario focuses on **contingency planning**. Additional profits are allocated to a reserve fund designed to absorb unforeseen shocks, whether geopolitical disruptions, supply chain interruptions, or regulatory shifts. This buffer protects the

MAJESTIC P.L.T. PROGRAM

platform from financial stress and ensures continuity of service even under adverse conditions. It's not just a safety net; it's a strategic asset that reinforces investor confidence and operational stability.

Investment: Enhancing In-House Capabilities

With contingency reserves in place, profits are then directed toward **strategic investment** in proprietary infrastructure and technology. This phase focuses on transitioning from third-party dependencies to **in-house capabilities**, when and where it makes economic and operational sense. Whether it's building cold-chain facilities, expanding data centers, or developing specialized logistics modules, these investments reduce long-term costs, increase control, and expand the platform's service portfolio. The goal is not just vertical integration, its intelligent integration, guided by data and ROI modeling.

This phase also includes workforce development, where technology enables more efficient labor without displacement. Repetitive, dangerous, or exposure-prone tasks are automated, while human roles evolve into specialized functions, AI supervision, ESG compliance, corridor analytics. This shift enhances productivity while creating a more resilient and future-ready workforce.

Expansion: Leveraging Cash for Strategic Growth

The final scenario is **expansion**, where accumulated profits are reinvested into new ventures aligned with MAJESTIC's hemispheric growth strategy. These may include new FILPROC corridors, regional hubs, or platform modules that extend the reach and impact of FRESH-24. Expansion is governed by strict financial protocols to ensure sustainability, every investment must reinforce the long-term vision, deliver measurable impact, and maintain operational integrity.

This phase transforms cash into leverage, fueling growth without compromising stability. It allows the platform to scale intelligently, compound its infrastructure value, and enter new markets with confidence and control.

FRESH-24's financial strategy is not just a roadmap; it's a governance model. It ensures that every dollar earned is deployed with purpose, every investment

MAJESTIC P.L.T. PROGRAM

is tied to strategic outcomes, and every phase of growth is built on a foundation of resilience, efficiency, and long-term vision.

4.8.5. 5-year financial proforma

FRESH 24										
Statements of Operations (Unaudited)

4.9. TEAM AND GOVERNANCE

FRESH-24 is powered by a team whose collective experience spans advanced systems architecture, hemispheric logistics, food trade, and infrastructure deployment. While the platform's intelligence layer is built by experts in simulation engines and modular business design, its execution is driven by professionals who have spent decades navigating the complexities of cross-border trade, cold-chain logistics, and regional production cycles.

The FRESH-24 team is not theoretical, it's operational. It includes:

- Logistics veterans who have designed and managed multimodal corridors across Latin America, the Caribbean, and the U.S., with hands-on experience in air, sea, and land freight coordination.
- Food trade specialists who understand perishability, market timing, and buyer behavior, ensuring that every product moves with precision and arrives with quality.
- Infrastructure planners who have deployed bonded warehouses, cold-chain systems, and customs pre-clearance zones in high-volume environments.
- Regional market experts who bring cultural fluency and local intelligence to every corridor, ensuring that operations are aligned with production realities and buyer expectations.

This team has already completed industry analysis, investor modeling, and simulation logic for FRESH-24. Their work reflects not just strategic vision, but executional depth, grounded in real-world complexity and designed for scalable impact.

To manage each FILPROC corridor and operational hub, FRESH-24 will deploy a **functionality-first talent selection process**. This process prioritizes:

- Proven **logistics and trade experience**, especially in time-sensitive, high-throughput environments.

MAJESTIC P.L.T. PROGRAM

- **Reliability and operational discipline**, with a focus on execution under pressure.
- **Regional origin and market fluency**, ensuring that each hub is led by individuals who understand local production cycles, regulatory frameworks, and buyer dynamics.

This ensures that every corridor is not only technically sound but **locally intelligent**, capable of adapting to market nuances and building trust with producers and buyers. Roles will be mapped to corridor-specific needs, with performance metrics and support systems to ensure accountability and growth.

Governance: Modular Autonomy, Unified Strategy

FRESH-24's governance model is designed to balance **independent execution with strategic cohesion**. Each operational component, whether a logistics hub, production node, or digital interface, functions as a **separate entity**, with its own management, financial tracking, and performance KPIs. This modular structure allows for agility, localized decision-making, and corridor-specific optimization.

Yet these entities are not isolated. They share a suite of **common services and strategic frameworks**, including:

- **Centralized technology infrastructure** for AI orchestration, simulation logic, and real-time dashboards.
- **Financial protocols** that maintain unified cashflow while allowing corridor-level reinvestment and contingency planning.
- **ESG and traceability systems** that ensure compliance, transparency, and buyer confidence.
- **Workforce development programs** that support labor evolution, specialization, and regional capacity building.
-

This shared backbone ensures **group-wide efficiency**, enabling rapid response to disruptions, coordinated planning across corridors, and consistent quality standards.

Data-Driven Decision Making & KPI Tracking

MAJESTIC P.L.T. PROGRAM

Every decision within FRESH-24 is guided by **real-time data and predictive analytics**. Dashboards provide visibility into inventory levels, route performance, buyer demand, and ESG metrics, allowing managers to act proactively rather than reactively. A **centralized KPI tracking system** monitors corridor health, financial performance, and operational efficiency, triggering alerts and recommendations when thresholds are breached.

Governance is not passive, it is **proactive, intelligent, and responsive**. It empowers each entity to operate independently while remaining aligned with the platform's strategic vision. It ensures that growth is not chaotic, it is **coordinated, measurable, and sustainable**.

4.10. RISK MANAGEMENT STRATEGY

MARKET RISK ANALYSIS

FRESH-24 faces several critical market risks rooted in buyer and supplier dynamics:

- **Buyer Concentration Risk:** Overreliance on a few dominant buyers can destabilize pricing and corridor throughput.
- **Demand Volatility:** Seasonal and cultural fluctuations in buyer behavior may lead to unpredictable volumes and underutilized capacity.
- **Price Sensitivity:** Buyers in certain segments prioritize cost over quality or traceability, pressuring margins.
- **Buyer Loyalty Fragility:** Without embedded incentives, buyers may easily switch platforms or sourcing channels.
- **Mismatch in Buyer Expectations:** Differences in packaging, delivery formats, or product specs can lead to rejections or delays.

To ensure corridor resilience and predictable throughput, FRESH-24 deploys a modular strategy framework addressing key market-side risks tied to buyer and supplier dynamics. For Buyer Concentration Risk, the platform diversifies its buyer base through tiered engagement models, volume-based incentives, and cross-corridor sourcing. Loyalty programs and dynamic pricing engines prevent overreliance on dominant clients while reinforcing long-term relationships.

MAJESTIC P.L.T. PROGRAM

To counter Demand Volatility, MAJESTIC integrates predictive modeling, flexible corridor activation, and cargo diversification. Buyers are incentivized to pre-book off-season volumes, while producers are coordinated to align supply timing with corridor cycles. Financial buffers ensure operational continuity during low-demand periods.

Price Sensitivity is managed through tiered product offerings, bundled value services, and buyer education. Dynamic pricing adjusts rates based on corridor load and seasonality, while volume incentives reward consistent purchasing behavior. These strategies shift buyer focus from unit cost to total value.

Addressing Buyer Loyalty Fragility, FRESH-24 embeds relationship dashboards, flexible contracts, and co-design loops to deepen buyer engagement. Loyalty-linked service tiers and cross-corridor incentives transform transactional behavior into strategic partnership.

Finally, to resolve Mismatch in Buyer Expectations, the platform uses corridor-specific profiling, standardized yet flexible service formats, and onboarding protocols. Expectation dashboards and feedback loops ensure clarity and adaptability, reducing friction and enhancing buyer satisfaction.

COMPETITORS RISK ANALYSIS

- **Price Undercutting by Low-Cost Competitors:** Competitors may offer cheaper logistics by compromising on quality, traceability, or compliance, pressuring FRESH-24's value-based pricing model and eroding buyer loyalty.
- **Platform Fatigue or Overlap:** Buyers and suppliers exposed to multiple trade platforms may disengage or switch frequently, making it harder for FRESH-24 to stand out or retain users.
- **Exclusive Contracts with Anchor Clients:** Incumbents may lock in key buyers or suppliers through long-term agreements, limiting FRESH-24's access to high-volume relationships and delaying corridor growth.
- **Niche Specialist Disruption:** Competitors focused on specific verticals (e.g., organic produce, halal meats) may outperform FRESH-24 in targeted segments, pulling away specialized demand.
- **Brand Perception Lag:** Despite superior systems, FRESH-24 may be perceived as less dependable than legacy players, especially in conservative or risk-averse markets.

MAJESTIC P.L.T. PROGRAM

- **Innovation Leapfrogging:** Tech-forward competitors may release advanced features (e.g., AI routing, ESG scoring) faster, shifting buyer expectations and forcing reactive development.
- **Corridor Cannibalization:** Competing platforms may activate similar trade routes, fragmenting volume, and inflating costs, undermining FRESH-24's economies of scale and strategic positioning.

FRESH-24 is engineered to thrive in a competitive landscape by deploying modular, simulation-driven strategies that neutralize key market threats while reinforcing platform defensibility. Against **price undercutting**, the platform shifts buyer focus from cost to total value, leveraging cold-chain integrity, ESG traceability, and reliability metrics. Segmented pricing and corridor-specific incentives allow FRESH-24 to serve diverse buyer tiers without compromising margin, while internal cost optimization ensures competitiveness without sacrificing quality.

To combat **platform fatigue and overlap**, FRESH-24 delivers founder-centric workflows, adaptive interfaces, and unified trade intelligence dashboards that reduce friction and elevate strategic clarity. The platform's differentiation narrative, centered on hemispheric corridor logic and modular governance, positions it as a system, not just a tool, while co-design loops and milestone-based onboarding deepen user engagement.

In response to **exclusive contracts with anchor clients**, FRESH-24 activates mid-tier buyers and suppliers through flexible agreements and corridor-specific incentives. Strategic partnerships and ecosystem integration allow the platform to bypass exclusivity barriers and maintain corridor volume, while simulation engines guide displacement strategies where needed.

To address **niche specialist disruption**, FRESH-24 embeds vertical modules tailored to organic, halal, and ESG-compliant cargo flows. Certified suppliers are onboarded with precision, and buyer-specific customization engines allow tailored service formats. Partnerships with certifiers and branded storytelling reinforce credibility and deepen market penetration.

FRESH-24 counters **brand perception lag** through strategic messaging, corridor performance showcases, and third-party validation. Testimonials and targeted

MAJESTIC P.L.T. PROGRAM

education campaigns reframe the platform as a resilient infrastructure system built for strategic control, not just logistics.

To stay ahead of **innovation leapfrogging**, FRESH-24 maintains a simulation-driven feature pipeline, modular deployment architecture, and competitive benchmarking engine. Innovation loops with corridor operators and strategic tech partnerships accelerate delivery of advanced capabilities, ensuring the platform evolves faster than rivals.

Finally, **corridor cannibalization** is mitigated through differentiation blueprints, strategic sequencing, and simulation-based planning. Cross-corridor incentives and competitor mapping ensure each route scales with precision, avoiding fragmentation and preserving economies of scale.

OPERATIONAL / TECHNOLOGICAL RISKS

- **Cold Chain Breakage in Transit:** Temperature excursions during air or ground transport can compromise product integrity, especially for meats and perishables. This risk is frequent in fragmented logistics environments or under peak-season pressure.
- **Air Cargo Capacity Constraints:** Limited availability of refrigerated cargo space, especially during seasonal surges, can delay shipments, inflate costs, and disrupt corridor schedules.
- **System Downtime or Latency:** Platform outages or slow response times can halt bookings, disrupt coordination, and erode buyer/supplier trust, particularly during high-volume corridor activations.
- **Customs Clearance Delays:** Regulatory bottlenecks at key air hubs can stall time-sensitive cargo, leading to spoilage, missed delivery windows, and reputational damage.
- **Data Integrity & Synchronization Failures:** Inaccurate or delayed data across modules (e.g., inventory, routing, KPI) can trigger misaligned decisions, cargo errors, and corridor inefficiencies.
- **Infrastructure Failures at Cold Facilities:** Power outages, equipment breakdowns, or poor maintenance at origin/destination nodes can disrupt storage conditions and compromise cargo quality.

MAJESTIC P.L.T. PROGRAM

FRESH-24's infrastructure is engineered to withstand the most probable and impactful risks across digital systems, air logistics, and cold-chain operations. To protect perishables, the platform deploys multi-layer temperature monitoring, redundant packaging, and carrier risk scoring, ensuring cargo integrity even under transit stress. Air cargo constraints are neutralized through pre-booked capacity, multi-carrier routing, and seasonal forecasting, allowing corridors to scale without bottlenecks.

System uptime is safeguarded via multi-region cloud architecture, auto-scaling infrastructure, and corridor-specific incident playbooks. Customs clearance delays are mitigated through automated documentation engines, strategic partnerships, and compliance dashboards that reduce friction at key air hubs.

Data integrity is preserved through modular sync checkpoints, real-time validation layers, rollback protocols, and provenance tracking, ensuring operational clarity and decision accuracy. Cold facility infrastructure is reinforced through resilience audits, backup power protocols, standardized contracts, and contingency network mapping, enabling uninterrupted cold-chain continuity.

FINANCIAL RISKS ANALYSIS

- **Revenue Volatility from Seasonal Demand:** Trade volumes for perishables like produce and meats fluctuate sharply across seasons, leading to unpredictable revenue cycles and corridor underutilization.
- **High Fixed Costs vs. Corridor Activation Pace:** Infrastructure, staffing, and platform development costs may outpace corridor monetization, creating pressure on cash flow and ROI timelines.
- **Delayed Buyer/Supplier Onboarding Impacting Cash Flow:** Slow activation of key users delays transaction volume and revenue realization, especially in newly launched corridors.
- **Currency Fluctuation Across Trade Corridors:** Cross-border transactions expose FRESH-24 to exchange rate volatility, which can erode margins and complicate pricing strategies.
- **Capital Allocation Misalignment Across Modules:** Investments may be unevenly distributed across platform features, corridors, or partnerships, reducing strategic impact and return efficiency.

MAJESTIC P.L.T. PROGRAM

- **Credit Risk from Buyer/Supplier Defaults:** Non-payment or delayed payment from trade participants can disrupt cash flow, damage corridor trust, and increase recovery costs.

FRESH-24's financial architecture is engineered for resilience, precision, and scalability across hemispheric trade corridors. To mitigate revenue volatility from seasonal demand, the platform deploys dynamic pricing engines, staggered corridor activations, and volume-based incentives that smooth income cycles. Subscription-based revenue layers add predictability, while seasonal risk pooling distributes exposure across cargo types and regions.

To address high fixed costs vs. corridor activation pace, FRESH-24 uses modular cost structures and ROI-driven corridor sequencing. Shared infrastructure agreements reduce upfront investment, lean launch protocols minimize early spend, and milestone-based capital deployment ensures funding aligns with corridor performance.

For delayed buyer/supplier onboarding, the platform accelerates activation through targeted incentives, readiness scorecards, and dedicated onboarding teams. Pre-qualified user pools reduce friction, and onboarding-linked revenue forecasting improves liquidity planning.

To mitigate currency fluctuation across trade corridors, FRESH-24 integrates corridor-level FX hedging, multi-currency settlement engines, and stablecoin options. FX risk scoring and dynamic pricing adjustments protect margins and ensure financial stability in volatile markets.

To prevent capital allocation misalignment across modules, the platform uses simulation-based planning, modular budgeting, and impact-weighted funding logic. Real-time dashboards and founder-governed protocols ensure capital is deployed where it drives strategic and financial value.

Finally, to manage credit risk from buyer/supplier defaults, FRESH-24 deploys pre-trade credit scoring, escrow-based payment flows, and trade insurance partnerships. Dynamic credit limits and automated recovery workflows contain exposure and preserve corridor trust.

Together, these strategies form a cohesive financial defense system, ensuring that FRESH-24 scales with discipline, adapts to volatility, and delivers investor-grade performance across every corridor and module.

TEAM / MANAGEMENT RISK ANALYSIS

- **Strategic Misalignment Across Leadership:** When founders, corridor managers, and technical leads operate with divergent priorities, it can fragment execution, dilute platform focus, and slow decision-making.
- **Talent Bottlenecks in Key Functional Areas:** Limited availability of specialized talent (e.g., cold-chain logistics, simulation modeling, corridor governance) can delay module deployment and corridor scaling.
- **Over centralization of Decision-Making:** Excessive reliance on a small group of decision-makers can create bottlenecks, reduce agility, and hinder corridor responsiveness.
- **Knowledge Silos Between Teams:** Lack of cross-functional visibility, especially between tech, logistics, and market-facing teams, can lead to duplicated efforts, missed risks, and inefficient scaling.
- **Founder Burnout or Role Dilution:** As the platform scales, founders may become stretched across too many domains, risking strategic drift, delayed pivots, or loss of execution clarity.
- **Inconsistent Corridor-Level Governance:** Without standardized management protocols, corridor teams may diverge in quality, compliance, and strategic alignment, undermining platform cohesion.

FRESH-24 is architected to maintain strategic coherence, operational velocity, and founder resilience as it scales across corridors and complexity. To mitigate risks around misalignment, talent bottlenecks, and governance fragmentation, the platform deploys a modular leadership framework grounded in simulation foresight and adaptive delegation.

Unified strategic blueprints and decision rights matrices ensure that every team, from corridor leads to platform engineers, operates with clarity and alignment. Talent gaps are addressed through fractional expert networks, cross-training programs, and acceleration partnerships that inject capability without overextending core teams. Governance decentralization empowers local execution while preserving strategic guardrails, enabling corridor autonomy without compromising platform integrity.

Knowledge silos are dismantled through shared repositories, simulation reviews, and rotation programs that build cross-functional fluency. Founder burnout is proactively managed via modular delegation, strategic time audits, and role

MAJESTIC P.L.T. PROGRAM

evolution roadmaps, ensuring leadership focus evolves with platform scale. Corridor governance is standardized through certification protocols, performance dashboards, and templated governance logic, reinforcing consistency across regions.

REGULATORY AND POLITICAL RISK ANALYSIS

- **Trade Policy Volatility:** Sudden changes in tariffs, import/export restrictions, or bilateral trade agreements can disrupt corridor economics, reroute cargo flows, and impact platform margins.
- **Regulatory Fragmentation Across Jurisdiction:** Inconsistent compliance standards across countries, covering food safety, cold-chain protocols, ESG mandates, and digital infrastructure, can complicate corridor activation and increase operational overhead.
- **Customs Clearance Delays & Bureaucratic Bottlenecks:** Political instability or administrative inefficiency can slow cargo movement, reduce corridor reliability, and erode user trust.
- **Data Sovereignty & Cross-Border Privacy Regulations:** Varying rules around data localization, user consent, and platform analytics may restrict how FRESH-24 operates its intelligence modules across regions.
- **Political Risk in Emerging Corridor:** Shifts in leadership, civil unrest, or policy reversals in key trade regions can threaten corridor uptime, partner reliability, and investment security.
- **ESG Compliance Enforcement Gap:** Uneven enforcement of environmental and labor standards across jurisdictions may expose FRESH-24 to reputational risk or limit access to ESG-linked capital.
- **Licensing & Platform Classification Ambiguity:** Unclear regulatory definitions around digital trade platforms, logistics orchestration, or financial services may lead to unexpected licensing requirements or legal exposure.

FRESH-24 is built to navigate the fragmented, volatile landscape of global trade with modular compliance, simulation foresight, and corridor-level adaptability. To counter **trade policy volatility**, the platform integrates real-time policy modeling, multi-corridor redundancy, and flexible contracting, ensuring continuity even amid tariff shifts or agreement reversals. **Regulatory fragmentation** is addressed through jurisdiction-aware compliance engines, localized legal partnerships, and corridor-specific playbooks that standardize governance while respecting regional nuance.

MAJESTIC P.L.T. PROGRAM

To mitigate **customs delays and bureaucratic bottlenecks**, FRESH-24 deploys digital documentation systems, embedded clearance agents, and simulation layers that forecast friction and reroute cargo proactively. **Data sovereignty and privacy regulations** are managed through localized data nodes, modular consent engines, and cross-border transfer protocols that ensure legal alignment without compromising intelligence workflows.

In politically unstable regions, the platform uses **geopolitical risk scoring**, stakeholder engagement protocols, and flexible corridor architecture to maintain uptime and protect capital. Political risk insurance adds a layer of financial resilience. For **ESG enforcement gaps**, FRESH-24 enforces standardized protocols, tracks performance via dashboards, and incentivizes supplier compliance, reinforcing trust and access to ESG-linked capital.

Finally, to resolve **licensing and platform classification ambiguity**, the platform maintains a regulatory mapping matrix, engages in preemptive licensing, and leverages adaptive architecture to pivot operationally as legal definitions evolve.

5. MAJESTIC AIR CARGO

Majestic Air Cargo is a vertically integrated aviation logistics system designed to advance MAJESTIC's hemispheric infrastructure objectives, delivering speed, control, and strategic clarity across production, logistics, and technology corridors. By embedding air freight directly into the platform architecture, Majestic eliminates third-party dependencies, compresses delivery timelines, and enables simulation-driven routing that aligns with perishability profiles, demand signals, and geopolitical conditions. Compared to outsourced models, this structure reduces fixed costs by up to 28%, improves corridor uptime, and enhances investor-grade visibility into logistics performance.

The platform leverages a shared intelligence layer with FRESH-24, including real-time demand forecasting, perishability scoring, and corridor simulation engines. This unified data architecture allows Majestic Air Cargo to dynamically adjust flight schedules, optimize load factors, and prioritize cargo based on shelf life, urgency, and market-side volatility. Every shipment is tagged with predictive routing logic, enabling the airline to reroute in response to customs delays, weather disruptions, or corridor fatigue, turning data into a tactical asset. The same orchestration engine that powers FRESH-24's supplier-buyer dynamics also guides aircraft utilization, cold-chain integrity, and cargo sequencing, ensuring that both platforms operate as a synchronized logistics ecosystem.

The Caribbean–South America corridor is a strategic anchor for Majestic's early deployment. Despite geographic proximity, the region suffers from fragmented infrastructure, inconsistent customs protocols, and limited cold-chain capacity. Majestic Air Cargo addresses these gaps by deploying specialized aircraft, digitized clearance workflows, and corridor-specific governance logic. Integrated with FRESH-24's real-time analytics, the airline can forecast demand spikes, pre-clear customs documentation, and dynamically allocate aircraft to high-yield routes, transforming what was once a logistical bottleneck into a competitive advantage.

Majestic Air Cargo is built around a clear set of objectives: perishable specialization, low-cost operations, minimal intermediation, and democratized access to air freight. The platform is designed to bring general cargo accessibility to the level of passenger flights, offering predictable schedules, transparent pricing, and corridor-level service guarantees. While FRESH-24 remains the anchor client, Majestic is open to third-party

MAJESTIC P.L.T. PROGRAM

shippers, SMEs, and regional producers, creating a scalable logistics backbone for the broader hemispheric economy. The shared technology stack ensures that external customers benefit from the same predictive routing, compliance automation, and ESG tracking that powers MAJESTIC's internal operations.

The management team behind Majestic Air Cargo brings decades of aviation experience, spanning commercial operations, cargo optimization, regulatory compliance, and fleet management. Their expertise ensures that the airline is not only operationally sound but strategically aligned with MAJESTIC's modular governance and corridor activation logic. From aircraft selection to route planning and customs integration, every decision reflects a deep understanding of both aviation mechanics and platform economics.

Looking ahead, Majestic Air Cargo will explore intermodal integration opportunities, linking air corridors with rail, maritime, and last-mile logistics to create seamless, multi-layered trade flows. This next phase will also include ESG-linked fleet upgrades, AI-driven load optimization, and corridor-specific carbon tracking, ensuring that growth is not only scalable, but sustainable. The shared data infrastructure between Majestic and FRESH-24 will continue to evolve, enabling predictive risk modeling, automated compliance workflows, and real-time performance dashboards across every corridor, aircraft, and shipment.

5.1. INDUSTRY OVERVIEW

The global air cargo industry in 2025 is undergoing a strategic transformation, driven by e-commerce acceleration, perishables demand, and the need for resilient, tech-enabled logistics infrastructure. Air cargo volumes are projected to reach 80 million tonnes, marking a 5.8% year-over-year growth, with revenues expected to hit \$157 billion globally²⁹. Latin America and the Caribbean are leading this surge, posting a 12.5% YoY increase in international cargo traffic, driven by perishables, nearshoring, and regional trade realignment³⁰.

²⁹ New Bloom Solutions, "Colombia Keeps the U.S. Floral Industry Blooming: Why 80% of America's Flowers Start Here," New Bloom Solutions, accessed September 11, 2025. <https://newbloomsolutions.com/colombia-keeps-the-u-s-floral-industry-blooming-why-80-of-americas-flowers-start-here>

³⁰ International Air Transport Association (IATA), "Air Cargo Market Analysis – April 2025," IATA, accessed September 16, 2025. <https://www.iata.org/en/iata-repository/publications/economic-reports/air-cargo-market-analysis-april-2025>

MAJESTIC P.L.T. PROGRAM

Majestic Air Cargo enters this landscape with a dual-market focus: anchoring operations in Colombia's robust internal market while leveraging corridor-level agility to expand across the Americas. Colombia alone handles over 580,000 tons of air cargo annually, with perishables, especially fresh-cut flowers, accounting for 90% of outbound volume³¹. This internal demand is amplified by FRESH-24's projected \$1.2B in annual throughput, creating a stable, high-frequency baseline for Majestic's initial deployment.

Externally, the rise of cross-border e-commerce, pharmaceutical cold chains, and time-sensitive industrial goods is reshaping air cargo priorities. E-commerce now drives 20% of global air cargo volumes³², with Latin America among the fastest-growing regions due to high smartphone penetration and expanding fulfillment infrastructure. Perishable goods, including produce, seafood, and specialty exports like asparagus, have seen volume increases of over 21% in key corridors such as Lima–Madrid and Bogotá–Miami. These trends align directly with Majestic's specialization in temperature-sensitive cargo and its integration with FRESH-24's perishability scoring and simulation logic.

Technological convergence is redefining competitiveness. AI-driven demand forecasting, automated customs workflows, and real-time cargo orchestration are no longer optional, they're foundational. Majestic Air Cargo leverages a shared intelligence layer with FRESH-24, enabling predictive routing, dynamic load optimization, and corridor-specific compliance automation. This not only reduces spoilage and delays but also positions Majestic as a logistics intelligence system rather than a conventional carrier.

With jet fuel costs down 21.2% YoY³³, and capacity growth lagging behind demand, operators with dedicated fleets and corridor-level control, like Majestic, are poised to capture margin and market share. The platform's modular architecture allows

MAJESTIC P.L.T. PROGRAM

rapid activation in underserved corridors such as the Caribbean–South America bridge, where infrastructure gaps and customs friction have historically constrained growth.

United States – Target Market Analysis

The United States remains the most mature and dynamic air cargo market in the world, offering both scale and strategic depth for Majestic Air Cargo’s hemispheric logistics ambitions. With a projected GDP of **\$27.1 trillion in 2025**, the U.S. economy continues to grow steadily at **2.1%**, supported by resilient consumer spending and a stable labor market³⁴. Urbanization exceeds **82%**, and a population of over **334 million**, with a median household income of **\$78,500**, drives consistent demand for both passenger and cargo aviation services³⁵.

Air travel in the U.S. is rebounding strongly post-pandemic, with domestic passenger enplanements expected to reach **980 million** this year. Business travel is regaining momentum, forecasted to grow **4.0% year-over-year**, while international inbound visits are surging at **8.8%**, fueled by major upcoming events like the 2026 FIFA World Cup and the 2028 Olympics³⁶. These trends not only boost passenger volumes but also stimulate cargo flows, particularly in high-frequency corridors such as New York–Los Angeles, Atlanta–Chicago, and Dallas–Denver.

From a cargo perspective, the U.S. handles over **8 billion freight ton-miles annually**, with e-commerce now accounting for **20% of total air cargo volume**³⁷. Major hubs like Memphis (FedEx), Louisville (UPS), Miami (LATAM gateway), and Los Angeles (Asia-Pacific trade) anchor a network that is both high-capacity and highly specialized. Despite its scale, the market continues to evolve, favoring carriers that offer corridor-level control, perishables specialization, and tech-enabled routing. With jet fuel costs down **21.2% year-over-year**³⁸, operators with dedicated fleets and predictive load optimization are positioned to capture margin and market share.

<https://www.iata.org/en/iata-repository/publications/economic-reports/air-cargo-market-analysis-april-2025>

MAJESTIC P.L.T. PROGRAM

Colombia represents a high-potential logistics hub for Majestic Air Cargo, offering a rare combination of strong internal demand, geographic centrality, and accelerating aviation infrastructure. With a projected **GDP of \$401 billion in 2025**, Colombia's economy continues to expand at a steady **3.1% annual growth rate**³⁹, driven by diversified exports, rising consumer demand, and increased foreign investment. The country's population stands at **52 million**⁴⁰, with over **77% urbanization**⁴¹, and a growing middle class whose purchasing power is reflected in a **median household income of \$9,800 USD**, up **4.2% YoY**⁴², signaling rising domestic consumption and travel propensity.

The aviation sector is a cornerstone of Colombia's economic engine, contributing **\$15.5 billion to GDP** and supporting over **920,000 jobs** across airlines, airports, tourism, and logistics⁴³. Air travel demand continues to surge: in the first four months of 2025 alone, Colombia transported **18.2 million passengers**, a **3.4% increase** over the same period in 2024. International traffic rose by **600,000 passengers**, reflecting Colombia's growing appeal as both a tourism and trade gateway⁴⁴. Cargo volumes also expanded, with **326,000 tons moved**, up **3.1% YoY**, reinforcing the country's role in regional supply chains⁴⁵.

Colombia's air cargo market is anchored by perishables, especially fresh-cut flowers, which account for **90% of outbound air freight**, with total annual cargo volumes exceeding **580,000 tons**⁴⁶. FRESH-24's projected **\$1.2B in annual throughput** will serve as a stable internal anchor for Majestic Air Cargo, enabling high-frequency, short-haul operations with predictable load factors and perishability-driven routing. The integration of Majestic's fleet with FRESH-24's simulation engine allows for real-time cargo orchestration, minimizing spoilage and optimizing corridor performance.

MAJESTIC P.L.T. PROGRAM

Origination and Destination (O&D) traffic patterns further validate Colombia's strategic positioning. **77% of passenger traffic is domestic**, but international flows are growing rapidly, especially to North America (44%), Latin America (40%), and Europe (16%)⁴⁷. Top international destinations include Miami, Madrid, Mexico City, New York, and Panama City, all of which align with Majestic's corridor activation logic. These routes not only support passenger flows but also represent high-yield cargo corridors for perishables, pharma, and e-commerce.

Colombia's aviation infrastructure is expanding to meet demand. Airports like El Dorado (BOG), José María Córdova (MDE), and Alfonso Bonilla Aragón (CLO) are investing in cargo terminals, cold-chain facilities, and digital customs integration. With average airfare costs down **6.6% over the past decade**, and increased accessibility across rural and secondary cities, Colombia is becoming a logistics launchpad, not just for domestic distribution, but for hemispheric trade.

Latin America – Target Market Overview (2025)

Latin America is emerging as a dynamic aviation and logistics region, with rising middle-class consumption, expanding airport infrastructure, and a surge in low-cost carriers reshaping accessibility. The region's **GDP is projected to grow at 2.1% in 2025**⁴⁸, with key economies like **Brazil, Mexico, Colombia, Chile, and Argentina** driving both domestic and international air traffic. Urbanization across the region exceeds **80%** and rising disposable incomes are fueling demand for both leisure travel and e-commerce-driven cargo flows⁴⁹.

The **Latin American aviation market** is valued at **\$38.55 billion in 2025**, forecasted to reach **\$59.3 billion by 2034**, growing at a **CAGR of 4.4%**⁵⁰. Passenger traffic continues to expand, with **42.3 million passengers transported in January 2025 alone**, marking a **2.4% YoY increase**⁵¹. Intra-regional routes, especially **Lima–Santiago, São Paulo–Buenos Aires, and Bogotá–Panama City**, are among the

MAJESTIC P.L.T. PROGRAM

busiest, reflecting strong demand for short-haul connectivity and perishables movement.

Brazil

Brazil is Latin America's largest aviation market, with over **100 million annual passengers** and a robust domestic network. The government has invested heavily in airport modernization, particularly in **São Paulo, Rio de Janeiro, and Brasília**, enhancing cargo throughput and cold-chain capacity. Brazil also leads in helicopter and general aviation operations, supporting remote access and high-value logistics⁵².

Mexico

Mexico ranks second in regional aviation, with **international arrivals growing 22% YoY** and strong O&D demand to the U.S., Canada, and Central America. The country is undergoing major infrastructure upgrades, including a new airport in Mexico City, and is a top performer in e-commerce-driven air cargo growth. Mexico's perishables and manufacturing sectors make it a prime candidate for Majestic's corridor integration⁵³.

Chile & AR Argentina

Chile shows strong international traffic growth, with **search volumes up 30% YoY**, and Santiago serving as a key hub for Southern Cone connectivity. Argentina, despite economic volatility, maintains high-value traffic to Europe and the U.S., with Buenos Aires–Miami and Buenos Aires–Madrid among the top-performing routes⁵⁴.

Cargo & O&D Demand

Air cargo demand is increasingly shaped by **e-commerce, perishables, and pharma**, with freighter aircraft orders rising across the region. LATAM Airlines alone operates **360 aircraft**, with 12 new deliveries planned in 2025, and is targeting **carbon neutrality by 2050**. O&D traffic is strongest between **Brazil–U.S., Mexico–**

MAJESTIC P.L.T. PROGRAM

Canada, and **Colombia–Panama**, with emerging corridors in **Peru**, **Ecuador**, and the **Dominican Republic** showing double-digit growth.

For Majestic Air Cargo, Latin America offers a modular growth landscape, where corridor activation can be tailored to perishables, e-commerce, and strategic trade flows. With simulation-driven routing, and predictive demand modeling, Majestic is positioned to orchestrate a new era of hemispheric logistics.

5.2. COMPETITIVE ANALYSIS

Majestic Air Cargo enters a Latin American market defined by rapid growth, infrastructure modernization, and intensifying competition among legacy carriers, regional operators, and platform-driven logistics players. The dominant incumbents, LATAM Cargo, Avianca Cargo, Copa Airlines Cargo, and MercadoLibre Logistics, each bring distinct strengths to the table, from expansive fleets and established cold-chain networks to deep regional connectivity and e-commerce integration. However, they also face structural limitations: legacy systems, constrained perishables handling, and limited corridor-level orchestration.

LATAM and Avianca lead in scale and perishables exports, particularly in Brazil and Colombia, but struggle to optimize inbound flows and dynamic routing. Copa's regional reach is strong, yet its belly-only model restricts cargo flexibility. Meanwhile, MercadoLibre is reshaping logistics through tech and fulfillment, but lacks direct control over air cargo operations.

5.2.1. Incumbent Airlines in the Latin American Marketplace (2025)

Latin America's aviation landscape is dominated by a handful of incumbent carriers that have shaped regional connectivity, cargo flows, and consumer expectations over the past two decades. These airlines, LATAM, Avianca, Copa Airlines, Azul, Gol, Volaris, and Viva-Aerobus, represent both opportunities and constraint for new entrants like Majestic Air Cargo. While they offer scale, infrastructure, and brand recognition, they also suffer from legacy inefficiencies, fragmented cargo strategies, and limited perishables specialization. Understanding their operational models, market positioning, and strategic blind spots is essential to defining Majestic's competitive edge.

MAJESTIC P.L.T. PROGRAM

LATAM Airlines Group

LATAM is the largest airline group in Latin America, operating across Brazil, Chile, Colombia, Peru, and Ecuador. It holds a commanding **52% market share at São Paulo Guarulhos (GRU)** and maintains dominant positions in Santiago and Lima. In 2024, LATAM operated **553,191 flights**, with a **7% YoY increase in frequency**, and served **694 routes**, though this number declined slightly due to network optimization⁵⁵.

Its fleet includes **35 narrowbody and 23 widebody aircraft**, with an average age of **8.4 years**, and no regional jets or turboprops. LATAM's aircraft are optimized for long-haul and high-density routes but lack specialization in perishables or short-haul cargo⁵⁶.

Avianca

Avianca is Colombia's flagship carrier and a regional powerhouse, operating **169 routes to 82 destinations**, including **43 domestic and 37 international routes**. It holds a dominant position in Colombia, with **80 active routes** and a strong presence in the U.S.–Latin America corridor, where it added **8,000 weekly seats in 2025**⁵⁷.

Its fleet includes **134 Airbus A320 family aircraft, 15 Boeing 787s, and 14 Airbus A330s**, with an average fleet age of **7.2 years**. Avianca's widebody aircraft are used on premium transcontinental routes, while narrowbodies dominate regional operations⁵⁸.

Schedules are robust, with **daily frequencies** on key U.S. routes like Miami–Bogotá and New York–Medellín, and **3–4x weekly service** on secondary routes.

⁵⁵ LATAM Airlines, LATAM lidera o setor aéreo brasileiro com 38% de mercado no primeiro trimestre de 2025, LATAM Sala de Imprensa. <https://www.latamairlines.com/br/pt/imprensa/noticias/latam-lideranca-anac-q125>

⁵⁸ Brilliant Maps, *Avianca Flight Route Destinations Map in 2025*, Brilliant Maps, <https://brilliantmaps.com/flight-maps/avianca-routes/>

MAJESTIC P.L.T. PROGRAM

Despite its strength in outbound perishables, especially flowers, Avianca's corridor logic remains outbound-centric, with limited inbound optimization and perishables diversity. Majestic's bidirectional perishables routing and simulation logic offer a clear advantage.

Copa Airlines

Copa Airlines operates from its Panama City hub, serving **88 destinations in 32 countries** with **375+ daily flights**. It holds a strategic position in short-haul connectivity across Central and South America, but lacks a dedicated freighter fleet⁵⁹.

Copa's fleet consists of **114 aircraft**, primarily **Boeing 737 MAX 8s**, with an average age of **6.1 years**. The uniform fleet supports operational efficiency but limits cargo flexibility, especially for perishables and oversized freight⁶⁰.

Copa's belly-only cargo model restricts perishables throughput and corridor adaptability.

Azul Linhas Aéreas

Azul is Brazil's largest carrier by network coverage, serving **160+ destinations** with **1,000 daily flights**. It holds a **41.8% market share on domestic routes**, with strong performance in underserved regional markets.

Azul's fleet includes **45 Embraer E2 jets**, **22 Airbus A330neos**, and **multiple ATR turboprops**, with an average fleet age of **6.7 years**. This mix supports regional access and cold-chain logistics, though perishables handling remains secondary⁶¹.

Gol Linhas Aéreas

Gol operates **74 destinations** with a fleet of **139 Boeing 737s**, including **7 freighters**, and maintains hubs in São Paulo, Brasília, and Rio de Janeiro. It

⁵⁹ Planespotters.net, Copa Airlines – Fleet Details and History, Planespotters.net.

⁶¹ Brazilian Airlines, *Azul Reports Strong Growth: 8.4% Rise in Passenger Numbers in H1 2025*, Brazilian Airlines. <https://brazilianairlines.com/azul-reports-strong-growth-8-4-rise-in-passenger-numbers-in-h1-2025/>

holds a **26.9% market share in Brazil**, down from its peak, and is undergoing restructuring under Chapter 11.

Gol's fleet includes **54 Boeing 737 MAX 8s**, with an average age of **8.2 years**, and **30 MAX 10s on order**. Its all-737 strategy supports cost efficiency but limits perishables handling and corridor flexibility⁶².

Volaris & Viva-Aerobus

These Mexican ULCCs dominate domestic traffic, with **Volaris holding 42%** and **Viva-Aerobus 36%** of the market. Volaris operates **113 Airbus aircraft**⁶³, 61% of which are NEO models, while Viva-Aerobus has **70 aircraft**, including **A320s and A321neos**, with an average age of **6.9 years**⁶⁴.

Schedules are dense on domestic routes, with **3–5x daily frequencies** between major cities, but international coverage remains limited.

5.2.2. Barriers to Market Entry in Latin American Air Cargo (2025)

While Latin America presents high-growth potential for air cargo, market entry is shaped by a complex web of regulatory, operational, and competitive constraints. These barriers vary by country but share common themes: limited slot availability at major hubs, restrictive bilateral agreements, and entrenched incumbent positioning.

Major airports like São Paulo (GRU), Mexico City (NLU), Bogotá (BOG), and Santiago (SCL) operate near capacity, with **slot allocation tightly controlled by national aviation authorities**. New entrants face challenges securing peak-hour slots, especially for freighter operations, which are deprioritized in favor of passenger traffic. Infrastructure constraints, such as limited cold-chain terminals and outdated cargo handling systems, further restrict operational flexibility.

Latin America's air transport liberalization remains fragmented. While some countries have embraced open skies (e.g., Chile, Panama), others maintain

⁶⁴ Planespotters.net, Viva Aerobus – Fleet Details and History, Planespotters.net.
<https://www.planespotters.net/airline/Viva-Aerobus>

MAJESTIC P.L.T. PROGRAM

restrictive bilateral air service agreements that limit foreign carrier frequencies, cargo rights, and route access. For example, Brazil and Argentina require reciprocity clauses and often cap third/fourth freedom rights, complicating multi-stop corridor activation. These agreements can delay route launches and require diplomatic negotiation or strategic partnerships.

Customs procedures across the region are inconsistent, with **varying clearance times, documentation requirements, and inspection protocols**. In countries like Peru and Ecuador, collaborative models between cargo operators and customs (e.g., Talma's integration with Peruvian authorities) have improved throughput, but such models are not yet widespread. Regulatory fragmentation increases compliance costs and reduces predictability, especially for perishables and pharma.

Incumbent carriers such as LATAM, Avianca Cargo, and Copa Airlines benefit from **preferential access to slots, legacy infrastructure, and long-standing government relationships**. Their dominance in key hubs creates informal barriers to entry, including lobbying influence and priority in cargo terminal access. Additionally, their scale allows them to undercut pricing on high-volume lanes, making it difficult for new entrants to compete on cost alone.

5.3. OPPORTUNITY

Majestic Air Cargo enters the Latin American aviation and logistics market with a precision-first model designed to serve a captive, underserved segment: perishables producers, platform operators, and corridor-based trade systems. While incumbents dominate by volume, Majestic is engineered for strategic depth, activating modular corridors, optimizing freshness-sensitive cargo, and embedding simulation-driven resilience into every route. The opportunity is not just market share, it's market orchestration.

FRESH-24, Majestic's sister company, is the primary user and strategic driver of corridor activation. As a perishables platform coordinating high-frequency trade between producers and buyers across the Americas, FRESH-24 demands a logistics backbone that guarantees freshness, predictability, and bidirectional flow. Existing carriers cannot meet these standards. Their models are outbound-centric, generalized, and reactive.

MAJESTIC P.L.T. PROGRAM

Majestic fills this gap by offering perishables-first routing, ESG-compliant fleet logic, and real-time corridor orchestration. FRESH-24's internal demand engine feeds directly into Majestic's simulation layer, enabling dynamic routing based on perishables type, temperature sensitivity, and buyer urgency. This transforms logistics from a cost center into a strategic asset.

Majestic Air Cargo is the logistics engine of FILPROC, Fully Integrated Production and Logistic Corridors, serving as the connective tissue between mapped production nodes and activated demand centers across the Americas. While FILPROC fuses production, logistics, and technology into a single intelligent infrastructure, Majestic is the carrier that operationalizes this intelligence in motion. It transforms FILPROC's corridor logic into real-world routing, ensuring that perishables and high-value goods move with precision, speed, and strategic control.

Majestic's fleet is designed around **perishables-first logic**, optimized for temperature-sensitive cargo and synchronized with harvest-to-market cycles. Every route is modeled through FILPROC's simulation engines, allowing Majestic to dynamically activate corridors based on real-time supply signals from farms, fisheries, and manufacturing hubs. This eliminates latency and replaces static scheduling with predictive orchestration.

Through FILPROC's logistics synchronization layer, Majestic integrates cold-chain systems, bonded warehousing, customs pre-clearance, and multimodal handoffs into a unified routing protocol. Whether moving flowers from Bogotá, seafood from Kingston, or produce from Querétaro, Majestic ensures that every shipment is tracked, quality-assured, and ESG-compliant. Its modular routing logic allows corridors to be replicated rapidly across new geographies and product categories.

On the technology front, Majestic interfaces directly with FILPROC's backbone, leveraging AI-driven production mapping, real-time orchestration, and dashboards to optimize every flight. It also powers the logistics layer for FRESH-24, enabling institutional buyers, auction platforms, and e-commerce channels to access live routing, traceability, and impact metrics.

The introduction of a cargo low-cost carrier (CLCC) in Latin America would represent a seismic shift in the region's air logistics landscape. Currently, the market is dominated by legacy carriers with high fixed costs, rigid scheduling, and generalized

MAJESTIC P.L.T. PROGRAM

service models that prioritize volume over precision. A CLCC, built around modular routing, lean operations, and perishables-first logic, would democratize access to air cargo, especially for small and mid-sized producers, regional platforms, and underserved corridors.

By stripping away legacy overhead and optimizing for short-haul, high-frequency routes, a CLCC could reduce cost-per-kilo by 20–35%, unlocking new demand from captive markets previously priced out of air transport. It would also introduce competitive pressure on incumbents, forcing them to rethink pricing, perishables handling, and corridor responsiveness. For platforms like FRESH-24, a CLCC offers direct control, real-time routing, and scalable access to secondary cities, transforming logistics from a bottleneck into a growth engine. In essence, the arrival of a cargo low-cost carrier wouldn't just disrupt the market, it would expand it.

5.4. SERVICE OFFERING

Majestic Air Cargo, is a Cargo Low-Cost Carrier, designed as a sectorial development mechanism. With bases in the USA, Colombia, Central America and in the Caribbean Islands, and focused on the agricultural and perishables industry, redefines airfreight as a strategic enabler of trade, productivity, and market access. Its mission is to disintermediate the logistics chain, placing it directly at the service of producers through low-cost, specialized, and fully integrated logistics services.

Majestic Air Cargo is part of a greater logistics ecosystem, from airside infrastructure to cold-chain routing, leveraging customized, high-tech platforms to deliver speed, cost-efficiency, and quality assurance. Its operational model aligns with FILPROC's logic, embedding production nodes into synchronized routing and offering producers real-time visibility, demand responsiveness, and shared value creation.

Majestic Air Cargo differentiator lies in its commercial reorientation: airfreight is no longer a transactional service, but a development instrument that strengthens regional competitiveness, expands market reach, and compounds value across the supply chain. With a deep commitment to customer relationships and service excellence, is positioned to become the preferred logistics partner for global perishables economy, and a scalable model for other productive sectors across the Americas.

5.4.1. COMPANY STATEMENT

Mission

Provide low-cost integrated logistics services to FRESH-24 and as a sector development tool, with the highest quality standards and with the premise of always seeking customer satisfaction.

Vision

To be the driving force behind sustained growth across Latin America's productive sectors, transforming air cargo into a strategic instrument of development, competitiveness, and market access. Majestic Air Cargo will lead as the region's most trusted provider of specialized, integrated logistics services, delivering the highest standards of freshness, precision, and operational excellence in cargo transportation to and from Latin America.

Values

Our values are the essence of Majestic Air Cargo and we will build based on them

- Customer service
- Quality, efficiency and speed
- Professionalism, ethics and integrity
- Security and commitment
- Innovation and sustainability
- Transparency, credibility and trust
- Teamwork
- Add value to the needs of our customers

Objectives

- One product, low-cost air cargo services, with efficient control on the cold chain, flying to airports that allow better market access and logistic connections for the interest of international commerce.
- Do aviation the right way.
- De-intermediate the logistic chain
- Permanent innovation and adaptation required from the clients and the market
- Be part of the solution, seek and develop all required feasible options required to keep the low-cost offer without trading off quality or reliability.
- Achieve client fidelity based on a reliable, safe, secure and sustainable offer.

5.4.2. OPERATIONAL SCOPE OF THE PROJECT

Majestic Air Cargo operates as the logistics backbone of FILPROC, with a dual-client architecture designed to serve both **platform-integrated perishables ecosystems** and the **broader industrial cargo market**. At its core, Majestic is engineered to meet the high-frequency, freshness-sensitive demands of **FRESH-24**, its primary client, by activating modular corridors that synchronize production nodes with buyer markets across the Americas. These operations prioritize perishables such as fresh-cut flowers, seafood, produce, and temperature-sensitive goods, leveraging simulation-driven routing, cold-chain integrity, and ESG-compliant fleet logic.

Simultaneously, Majestic extends its capabilities to **external clients across agriculture, manufacturing, pharma, and e-commerce**, offering scalable access to integrated logistics services. Through FILPROC's orchestration layer, Majestic provides real-time routing, bonded warehousing, customs pre-clearance, and multimodal handoffs, delivering speed, traceability, and cost efficiency to producers, platforms, and institutional buyers alike.

Majestic's operational scope spans **domestic, regional, and international corridors**, with dynamic routing logic that adapts to perishables density, infrastructure readiness, and market-side demand. Whether serving a platform's auction cycle or a manufacturer's replenishment schedule, Majestic delivers logistics not as a commodity, but as a strategic instrument of growth, control, and competitiveness.

5.4.2.1. Operational description

Operational bases:

Greensboro's Piedmont Triad International Airport (GSO).

GSO is Majestic Air Cargo's primary U.S. base. Located at the heart of North Carolina's manufacturing and agricultural belt, GSO provides direct access to key perishables markets, multimodal infrastructure, and uncongested airspace, making it ideal for time-sensitive cargo operations.

MAJESTIC P.L.T. PROGRAM

GSO's cargo facilities are equipped with bonded warehousing, cold-chain handling, and customs pre-clearance, enabling Majestic to synchronize inbound perishables from Latin America with outbound replenishment and distribution across the U.S. Southeast. Its proximity to major interstates (I-40, I-85) and rail corridors enhance ground connectivity, while its underutilized slot capacity allows for flexible scheduling and rapid corridor activation.

[Miami International Airport \(MIA\)](#)

serves as Majestic Air Cargo's U.S secondary base of operations, anchoring its **perishables entry point into the United States** and enabling high-frequency connectivity across the Americas, Europe, and Asia. As the **largest perishables hub in the U.S.**, MIA handles over **70% of all airborne perishables entering the country**, making it indispensable for FRESH-24's inbound routing and corridor activation.

MIA's infrastructure is purpose-built for perishables logistics. The airport is home to the **largest on-airport cooler in North America** and is currently expanding with a **340,000 sq ft Future-Ready Phytosanitary and Cold Chain Processing Facility**, capable of treating over **20,000 TEUs per year** and storing more than **35,000 pallet positions**. This facility integrates USDA-approved irradiation, cold storage, and high-throughput logistics services, ensuring compliance, shelf-life extension, and rapid distribution for temperature-sensitive cargo.

With direct connections to over 160 destinations, frequent routes to Latin America and the Caribbean, and efficient links to Port-Miami and ground networks, this location enables quick customs clearance, flexible scheduling, and ESG-compliant routes, ideal for high-value or time-sensitive cargo.

[Rionegro's international airport "Jose Maria Cordoba" \(MDE\)](#)

Located near Medellin, this airport is the second in number of operations after Bogota's, from here 18% of all fresh cut flowers are exported to north America, its central location provides connection to major production centers. Being the second airport in Colombia, still is

MAJESTIC P.L.T. PROGRAM

very under used, allowing the opportunity to grow the market departing from there, taking the advantage of Bogota's airport which is almost completely at full capacity.

[Alfonso Bonilla Aragón International Airport \(CLO\)](#)

Located in Cali, Colombia, serves as a vital regional hub for perishables logistics and a strategic node within Majestic Air Cargo's FILPROC corridor network. Positioned in the heart of Colombia's **Valle del Cauca**, one of the country's most productive agricultural regions, CLO offers direct access to high-volume exports such as **fresh-cut flowers, fruits, and vegetables**, making it a natural fit for FRESH-24's sourcing and routing logic.

CLO's logistics importance lies in its **proximity to production zones**, uncongested airspace, and growing cold-chain infrastructure. While not as saturated as Bogotá's El Dorado, Cali offers **faster turnaround times**, lower slot competition, and increasing investment in cargo handling capabilities. Its location also enables **multimodal integration** with Colombia's 4G and 5G infrastructure projects, connecting producers to ports, highways, and regional airports with improved efficiency.

[José María Córdova International Airport \(MDE\)](#)

MDE is Colombia's second-largest air cargo hub and a cornerstone of Majestic Air Cargo's perishables strategy. Positioned at the heart of Antioquia's floriculture and agricultural belt, MDE handles a significant share of the country's **fresh-cut flower exports**, especially during peak seasons like Valentine's Day and Mother's Day. Its proximity to high-density production zones makes it an ideal launch point for FILPROC corridors serving North America, Central America, and the Caribbean.

MDE's cargo terminal supports **over 92,000 tons of international freight annually**, with infrastructure tailored for perishables, including cold-chain facilities, customs pre-clearance, and phytosanitary inspection zones. The airport's ICAO 4F classification and ability to

MAJESTIC P.L.T. PROGRAM

accommodate widebody freighters ensure operational flexibility and scalability for Majestic's perishables-first fleet.

For FRESH-24, MDE functions as a **primary export gateway**, enabling synchronized harvest-to-market cycles and direct access to buyers via Majestic's simulation-driven routing. Its uncongested airspace, expanding international connectivity, and integration with regional ground networks make it a high-performance logistics node within the FILPROC framework.

5.4.2.2. PRODUCT OFFERING

Majestic air cargo will provide the services through 3 different models:

- **Direct Charter**

The Direct Charter model is Majestic Air Cargo's core operational and commercial modality, designed to deliver dedicated, high-performance air logistics services to its primary client, FRESH-24. Under this model, Majestic operates full aircraft charters on a corridor-by-corridor basis, activated through FILPROC's simulation engine and tailored to perishables-first routing logic. Each flight is scheduled based on real-time demand signals, harvest cycles, and buyer-side requirement, ensuring unmatched freshness, speed, and strategic control.

As the primary revenue stream, Direct Charter flights are fully contracted by FRESH-24, enabling synchronized logistics across mapped production nodes and institutional buyers. These flights include the full suite of Majestic's integrated services:

- Cold-chain integrity and temperature-controlled handling
- Customs pre-clearance and bonded warehousing
- Simulation-driven scheduling and corridor optimization
- Platform integration for auction cycles and e-commerce fulfillment.

- **Indirect Charter**

MAJESTIC P.L.T. PROGRAM

The **Indirect Charter model** is Majestic Air Cargo's secondary logistics modality, designed to serve market segments with **smaller, consistent cargo requirements** that do not justify full aircraft chartering. This model enables year-round access to Majestic's integrated logistics services for producers, exporters, and platforms who operate at lower volumes but require reliability, speed, and perishables-first handling, also to sell available space in the routes chartered by FRESH-24.

Under this structure, Majestic partners with a **General Sales Agent (GSA)**, an embedded component of the Majestic program who charters round-trip aircraft capacity and then **sells payload space by the kilogram** to qualified customers. These clients benefit from all the service features of the Direct Charter model.

5.4.2.3. AIRCRAFT SELECTION

Based on the projected routes, the aircraft selection was to establish the most efficient aircraft in the following variables:

- Hot and high operation
- Fuel efficiency
- Maintenance hour per cycle, 3 to 5 flight hours optimum ratio
- Available lifetime and OEM long term support
- Aircraft availability
- Other operators
- Reliability
- Payload vs range

A-321P2F (First option)

The Airbus A321P2F (Passenger-to-Freighter conversion) is a highly efficient, narrow-body cargo aircraft optimized for medium-haul operations, making it an ideal fit for Majestic Air Cargo's perishables-first corridor strategy. With a payload capacity of up to 28 tonnes and 24 container positions across its main and lower decks, it offers a strong balance between volume and fuel efficiency. Its range of approximately 2,000 nautical miles enables high-frequency routing across Latin America, the Caribbean, and southern U.S. markets, supporting both Direct and Indirect Charter models with precision and reliability.

Boeing 757-200P2F (second option)

MAJESTIC P.L.T. PROGRAM

The **Boeing 757-200P2F** is a mid-size, narrow-body freighter known for its **exceptional payload-to-range ratio**, making it a versatile asset for Majestic's longer perishables corridors and high-volume charter operations. With a **maximum payload capacity of up to 39,800 kg (87,700 lbs)** and a **range of approximately 3,150 nautical miles (5,830 km) fully loaded**, it supports transcontinental and deep regional routes with efficiency and reliability. The aircraft accommodates **15 standard ULD positions on the main deck**, plus additional bulk cargo in the lower hold, allowing for flexible configuration of perishables, pharma, and general cargo

Boeing 777 Freighter

The **Boeing 777 Freighter** is the world's most capable twin-engine cargo aircraft, purpose-built for **long-range, high-payload operations**. With a **maximum revenue payload of up to 102 tonnes** and a **range of approximately 4,970 nautical miles**, it enables nonstop connectivity between Latin America and major global markets such as Europe, Asia, and North America. The aircraft supports **31 main deck and 10 lower deck pallet positions**, offering exceptional volumetric capacity for perishables, pharma, and general cargo. Its fuel efficiency and reliability make it a preferred choice for replacing older widebody freighters like the 747-400F, while maintaining superior economics and ESG compliance.

5.4.2.4. ROUTE STRUCTURE

Majestic Air Cargo serves FRESH-24 through a strategically engineered **triangulated route structure** connecting the **United States, Colombia, and the Caribbean islands**, designed to meet the platform's perishables-first logistics requirements with precision and speed. These routes are activated via Majestic's Direct Charter model, ensuring synchronized harvest-to-market cycles from Colombia's agricultural hubs, rapid delivery to institutional buyers in the U.S., and redistribution or replenishment across key Caribbean nodes, all with cold-chain integrity and simulation-driven scheduling.

5.5. OPERATIONS PLAN

ADMINISTRATIVE, CUSTOMER SERVICE, AND LABOR FRAMEWORK

MAJESTIC P.L.T. PROGRAM

Administrative Structure

Majestic Air Cargo's administrative structure is built on a lean, high-performance framework that prioritizes real-time visibility, accountability, and operational clarity across all departments. At its core is a unified tech layer, combining proprietary systems and third-party platforms, to enable live tracking, automated workflows, and seamless data exchange. This infrastructure supports key operational axes including human resources management, compliance, traceability, and performance governance, ensuring that every process is auditable, responsive, and aligned with strategic objectives. By minimizing human error and maximizing process reliability, Majestic creates a logistics environment where decision-making is data-driven, and execution is frictionless.

Customer Service Model

Customer service model mirrors this operational philosophy, blending **technology and human engagement** to deliver premium support across all touchpoints. A third-party call center handles inbound inquiries with speed and professionalism, while **commercial portfolio agents** are empowered through integrated dashboards to resolve client needs proactively. Web-based channels with **real-time chat, shipment tracking, and tailored response logic** ensure that every customer interaction is transparent, efficient, and personalized. This multi-channel approach, underpinned by Majestic's tech ecosystem, guarantees that service delivery is not only consistent, but strategically aligned with the company's commitment to excellence and platform-driven logistics.

Labor structure and compensation

- **Pay Rates and Scales:** Crew pay rates will align with industry averages to attract and retain skilled personnel. For other roles, salary bands will be linked to the minimum wage yet set above market minimums to promote employee commitment and responsibility, laying the foundation for a positive workplace culture.
- **Benefits:** All employees will receive benefits as defined by internal policy, including performance-based bonuses tied to the achievement of KPIs, team accomplishments, and company financial results. A set percentage of net profit will be allocated annually for these benefits. Human Resources will also establish non-monetary incentives to further enhance the work environment.
- **Contracts and Employment Terms:** All staff will hold direct contracts with Majestic Air Cargo. Salaries will be adjusted annually in line with the minimum

MAJESTIC P.L.T. PROGRAM

wage indicator, ensuring equitable conditions and consistent benefit programs. The company is committed to a non-union labor structure, relying on competitive compensation and comprehensive benefits to promote employee satisfaction and retention.

Maintenance

Maintenance will be under third party contract until fleet size is enough to establish Majestic's maintenance infrastructure:

Line: daily, weekly and "A" checks will be performed by a certified FAA shop, will be supervised and audited by the company's internal maintenance structure.

Also, a mechanic must be a part of the crew to be the primary link with the maintenance response system and ensure reliability and continuous airworthiness.

Heavy checks will be performed with a certified MRO.

MAJESTIC P.L.T. PROGRAM

Flight operations.

Will be performed under the requirements established under FAR 121, sufficient crews will be available to support the 24/7 operations with all safety standards.

Training also will be in accordance with the regulations and additional tools for skill development will be provided.

Fuel policies

As fuel represents more than 45% of the company's cost structure, a fuel conservation program will be developed and established, all flight fuel consumption will be monitored and analyzed to prevent over burning or poor operation of the aircraft. This doesn't represent any risk for the flight; all fuel quantities will be enough to fulfill the mission and will have a 10% extra fuel plus a minimum of an extra 1 hour of flight fuel. Flight engineering ops will be monitoring and giving feedback in both directions with the crews to have reliable statistics that can provide information to make purchasing policies.

MAJESTIC P.L.T. PROGRAM

A substantial difference in the fuel price between Colombia and the U.S. is a constant, so a tankering system will be established to monitor permanently the fuel prices in departure / destination airports to load the most amount of fuel within the payload, weight and balance and commercial requirements for the flight.

Technology (IT, AI, WEB Services)

Majestic Air Cargo's technology layer is the operational backbone of its perishables-first logistics model, designed to unify customer-facing interfaces, flight operations, administrative workflows, and financial governance into a single, integrated ecosystem. From the moment a customer initiates a reservation, whether through direct charter, indirect charter, or platform-based booking, the system activates a dynamic routing engine that aligns cargo requirements with available aircraft, corridor schedules, and perishables handling protocols. This front-end interface is seamlessly connected to Majestic's flight operations module, which manages aircraft allocation, crew scheduling, route simulation, and cold-chain compliance in real time.

At the core of this architecture is a modular platform that synchronizes **administrative tasks**, including HR management, compliance tracking, and documentation, with **flight and maintenance operations**, ensuring that every component of the business operates under unified logic. Maintenance schedules are linked to aircraft utilization data and spare parts inventory, allowing predictive servicing and budget alignment. The system flags parts consumption against corridor profitability, enabling strategic decisions on fleet deployment and asset optimization. Safety and security protocols are embedded throughout the cargo lifecycle, with automated alerts for temperature deviations, customs anomalies, and route disruptions, ensuring traceability and integrity from origin to destination.

Financial operations are fully integrated into the platform, with a built-in **payment gateway** that supports multi-currency transactions, escrow logic for platform clients, and automated invoicing tied to cargo milestones. Budgeting tools correlate operational costs, fuel, crew, maintenance, and ground handling, with revenue streams from both direct and indirect charter models, providing real-time visibility into margin performance and corridor ROI. This holistic tech layer transforms Majestic from a traditional air cargo operator into a digitally orchestrated logistics engine, where every decision is data-driven,

every process is traceable, and every shipment is part of a larger strategic flow.

5.6. FINANCIAL ANALYSIS

5.6.1. Revenue Streams

Direct Charter

The Direct Charter product is designed for enterprise-level clients capable of securing a full round-trip aircraft originating from strategic hubs such as Rionegro. Under this model, the customer defines the cargo volume within aircraft payload limits, with Majestic providing end-to-end operational support, including perishables processing, cold chain integrity, security screening, aircraft loading/unloading, and all aeronautical and airport services.

This product is ideal for high-season perishables exports (e.g., floriculture, fresh produce) where timing, shelf-life, and market urgency demand dedicated lift capacity.

Pricing Model:

Base Fare + Variable Fare + Ancillary Costs = Operational Cost

Operational Cost × Profit Margin (15–20%) = Sale Price

The Direct Charter model within Majestic Air Cargo is structured into two distinct variants: **Fixed Contract** and **Occasional Contract**. The Fixed Contract is deployed in strategic partnership with Fresh24, positioning Majestic as its primary air logistics provider for perishables. This variant operates with lower profit margins, intentionally designed to enhance product competitiveness and ensure consistent corridor activation aligned with shelf-life and market urgency. In contrast, the Occasional Contract serves ad-hoc clients requiring dedicated lift capacity on a non-recurring basis. Due to the unpredictability of demand and routing complexity, this variant carries higher profit margins to offset forecasting challenges and operational risk, while still maintaining Majestic's standards for cold chain integrity and service reliability.

MAJESTIC P.L.T. PROGRAM

Indirect Charter – Payload Fractionalization via GSA Network

The Indirect Charter product serves mid-sized and SME exporters with consistent but fractional cargo needs. Flights are chartered round-trip by a General Sales Agent (GSA), who assumes commercial risk and resells payload capacity by kilogram to multiple clients. All operational services, cold chain control, cargo handling, and security, mirror those of the Direct Charter.

This model supports year-round perishables flow, balancing corridor occupancy and market accessibility.

Pricing Model:

Base Fare + Variable Fare + Ancillary Costs = Operational Cost

Operational Cost × Route Index × Profit Margin = Sale Price per kg

The Route Index adjusts pricing based on corridor length, airport fees, traffic density, and perishables sensitivity. It ensures competitive pricing while preserving margins and service quality.

Majestic Air Cargo will establish its own dedicated General Sales Agent (GSA) to manage and commercialize the Indirect Charter flight model across its core corridor network. This internal GSA will be responsible for optimizing payload distribution, pricing per kilogram, and ensuring alignment with perishables demand signals from Fresh24. However, Majestic remains strategically open to collaborating with external GSAs in cases where routes fall outside its dedicated corridor structure or where mutual benefits, such as lower operational costs, superior infrastructure access, or enhanced efficiency metrics, justify external engagement. This hybrid approach ensures both control and flexibility, allowing Majestic to maximize aircraft occupancy, preserve service quality, and expand market reach without compromising its perishables-first logistics standard.

Value-Added Services

Majestic offers modular add-ons to enhance cargo integrity and traceability:

- Temporary Cold Storage – Buffer zones at origin/destination for perishables staging
- Live Cargo Tracking – Real-time visibility across air and ground segments

MAJESTIC P.L.T. PROGRAM

5.6.2. Cost Structure

Majestic Air Cargo operates with a meticulously structured cost model designed to support corridor-based scalability, perishables-first logistics, and strategic pricing. The cost architecture is divided into three primary categories: Fixed Operational Costs, Fixed Indirect Costs, and Variable Costs, each contributing to the total cost of flight operations and informing pricing logic across both direct and indirect charter products.

Operational Costs

These costs represent the baseline expenditures required to maintain Majestic's core aviation and ground operations, regardless of flight frequency or payload volume. They ensure platform readiness, regulatory compliance, and service continuity across all corridors.

- **Operations Payroll:** Covers salaries for flight planners, dispatchers, and corridor operations staff who manage routing, scheduling, and SLA enforcement.
- **Maintenance Payroll:** Supports technical personnel responsible for aircraft upkeep, safety checks, and compliance with aviation standards.
- **Third-Party Services:** Includes contracted support for specialized tasks such as perishables handling, customs coordination, and airport logistics.
- **Ground Operations Payroll:** Funds personnel managing cargo loading/unloading, cold chain staging, and ground-side coordination.
- **Direct Aircraft Cost:** Reflects fixed costs tied to aircraft ownership or leasing, including depreciation and insurance.

MAJESTIC P.L.T. PROGRAM

- **Subscriptions and Software:** Covers aircraft's digital infrastructure, simulation engines, routing algorithms, and Fresh24 integration modules.
- **Other Indirect Operational Costs:** Includes miscellaneous expenses such as training, uniforms, and operational certifications.
These costs are absorbed across all flights and corridors, forming the backbone of Majestic's operational reliability.

Fixed Indirect Costs

This category encompasses strategic and administrative overhead, essential for governance, compliance, and long-term platform resilience.

- **Management Payroll:** Funds executive leadership and program management, ensuring strategic alignment and corridor activation logic.
- **Administrative Fixed Costs:** Includes office infrastructure, legal services, and corporate governance functions.
- **Unforeseen Reserves:** Allocated for contingency planning, risk mitigation, and geopolitical volatility buffering.
These costs enable Majestic to maintain strategic clarity, investor confidence, and regulatory agility across hemispheric operations.

Variable Costs

Variable costs scale directly with flight activity and payload volume. They are the most dynamic component of Majestic's cost model and are tightly linked to corridor performance and perishables urgency.

- **Fuel:** The dominant cost driver, influenced by route length, aircraft type, and fuel market volatility. Majestic uses simulation models to optimize fuel efficiency across corridors.
- **Ground Operations:** Includes airport fees, cargo handling, perishables staging, and cold chain logistics at origin and destination.
- **Aeronautical Costs:** Covers airspace navigation fees, landing charges, and regulatory levies.
- **Maintenance per Cycle:** Reflects wear-and-tear costs tied to flight frequency and aircraft utilization.
- **Crew Support:** Includes travel, lodging, and per diem for flight crews operating across multi-corridor routes.

MAJESTIC P.L.T. PROGRAM

Majestic's pricing engine incorporates these variable costs into both direct and indirect charter models, adjusting for perishables sensitivity, corridor saturation, and route complexity.

MAJESTIC P.L.T. PROGRAM

5.7. RISK ANALYSIS

The following chapter presents a comprehensive risk analysis for Majestic Air Cargo, structured across six critical domains: market access, competitive landscape, team and management capacity, financial resilience, operational integrity, and regulatory/political exposure. Each area has been evaluated to identify potential vulnerabilities that could impact corridor activation, service continuity, or strategic scalability. By mapping these risks against Majestic's modular architecture and perishables-first mission, the analysis provides a clear foundation for mitigation planning, investor confidence, and long-term platform resilience.

Market Risk Analysis:

- **Access to Objective Market:** Majestic faces potential barriers in reaching institutional buyers and high-volume clients outside its core platform ecosystem. Limited brand recognition, regulatory hurdles, or lack of bilateral agreements could restrict access to strategic markets, impacting corridor activation and revenue scalability.
- **Niche Market Dependency (FRESH-24)** Reliance on FRESH-24 as a primary client creates concentration risk. While the partnership drives initial growth, overdependence on a single perishable platform may expose Majestic to volatility in platform performance, contract renegotiations, or strategic shifts that could affect flight volumes and financial stability.
- **Traditional Market Structure Dependency (MIA–Ground Transport):** Majestic's routing through legacy corridors like Miami–Grenada may be constrained by entrenched operators, slot limitations, and outdated customs protocols. This dependency can reduce flexibility, increase operational costs, and limit differentiation in service delivery.
- **Seasonal Offer–Demand Imbalance:** Perishables logistics is inherently cyclical, with peak seasons (e.g., Valentine's Day, Mother's Day) driving high demand and off-peak periods resulting in underutilized capacity. Without dynamic scheduling and diversified cargo sources, Majestic risks inefficient fleet usage and margin compression.
- **No Compensation (Return) Cargo:** Many northbound perishables routes lack corresponding southbound cargo flows, leading to empty return legs and reduced aircraft utilization. Without compensation cargo or strategic backhaul planning,

MAJESTIC P.L.T. PROGRAM

Majestic may face elevated cost-per-kilo metrics and diminished corridor profitability.

To address the risk of **Access to Objective Market**, Majestic Air Cargo deploys a layered strategy focused on affordability, credibility, and cross-sector adaptability. The **low-cost strategy** positions Majestic as a competitive alternative to legacy carriers, offering streamlined pricing and perishables-first service without compromising quality. This is reinforced by a **flat-rate model**, which simplifies client onboarding and reduces friction in contract negotiation, particularly for institutional buyers and regional exporters seeking predictable logistics costs.

Majestic further differentiates through **specialization and reliability**, emphasizing cold-chain integrity, simulation-driven routing, and ESG-compliant operations as core value propositions. These capabilities build trust and position Majestic as a premium yet accessible provider. To expand market reach, the company validates a **multi-sector business model**, adapting its tech and operational infrastructure to serve adjacent industries such as pharma, electronics, and humanitarian aid. All of this is underpinned by a modular **operational model concept**, which integrates flight ops, customer service, and administrative workflows into a unified system, ensuring consistency, scalability, and strategic alignment across every market entry point.

To mitigate the risk of **Niche Market Dependency**, particularly Majestic Air Cargo's reliance on FRESH-24, a multi-pronged strategy has been designed to ensure operational resilience and revenue diversification. First, **client portfolio diversification** expands Majestic's reach beyond perishables platforms by onboarding mid-sized exporters and regional clients through tailored service packages and GSA-led corridor activation. Simultaneously, **corridor multiplexing** enables parallel route deployment, allowing Majestic to serve multiple markets without disrupting core operations.

To safeguard contractual exposure, **flex clauses** are embedded into the FRESH-24 agreement, ensuring volume guarantees and performance-linked adjustments. Majestic also pursues **cross-sector expansion**, adapting its logistics infrastructure to serve adjacent industries such as pharma and humanitarian aid. These efforts are supported by an **integrated risk monitoring dashboard**, which tracks client concentration, corridor utilization, and seasonal volatility in real time. Finally, an

MAJESTIC P.L.T. PROGRAM

investor-backed resilience fund provides financial cushioning against platform-side disruptions, reinforcing Majestic's ability to scale sustainably while maintaining strategic independence.

To mitigate dependency on traditional market structures like MIA predominance for perishables entry, and Ground Transport accessibility, Majestic Air Cargo deploys a blend of corridor innovation, strategic partnerships, and technology-driven process redesign. By activating alternative routes, integrating digital customs workflows, and decentralizing ground operations, Majestic reduces exposure to legacy bottlenecks and monopolized infrastructure, while reducing costs, time and risks for the cargo. These strategies are reinforced by client education, multimodal planning, and regional hub development, ensuring that Majestic's perishables-first model remains agile, scalable, and resilient across evolving logistics landscapes.

To mitigate Seasonal Offer–Demand Imbalance, Majestic Air Cargo deploys a modular strategy that blends dynamic scheduling, multi-sector cargo logic, and predictive demand planning. By adjusting fleet allocation, offering flexible charter packages, and incentivizing off-peak utilization, Majestic ensures consistent aircraft performance and revenue continuity. These strategies are reinforced by integrated forecasting tools and financial dashboards, allowing the company to anticipate volatility, optimize margins, and maintain strategic control across all seasonal cycles.

To mitigate the risk of **No Return (Compensation) Cargo**, Majestic Air Cargo deploys a strategic blend of **cargo development, multimodal integration, dynamic pricing, and payload diversification**. These strategies aim to fill southbound legs with viable cargo, stabilize aircraft utilization, and protect corridor-level margins. By embedding margin monitoring and route rebalancing into its tech layer, Majestic ensures that every flight, whether outbound or return, contributes to operational efficiency and strategic resilience.

Competitors risk Analysis

- **Price War:** Competitors may aggressively lower rates to retain market share or block Majestic's entry, especially in high-volume perishables corridors. This can erode margins and force unsustainable pricing strategies if not countered with differentiated value.

MAJESTIC P.L.T. PROGRAM

- **Operational Model Copy:** Established carriers or new entrants may replicate Majestic's modular, tech-driven logistics model, diluting its competitive edge and reducing differentiation in the eyes of institutional buyers or platform clients.
- **Current Air Carriers' Predominance Based on Tradition and Experience:** Legacy carriers benefit from long-standing relationships, brand trust, and embedded contracts with customs, ground handlers, and exporters. Their institutional inertia can slow Majestic's market penetration despite superior service or innovation.
- **Hidden Blocks and Attacks to the Company:** Majestic may face covert resistance such as slot denial, regulatory delays, misinformation campaigns, or lobbying efforts designed to obstruct corridor activation or undermine credibility, especially in markets dominated by entrenched players.

To counter the threat of a **Price War**, Majestic Air Cargo deploys a strategic blend of **cost efficiency, pricing clarity, client retention, and differentiated service delivery**. By locking in medium-long term contracts, targeting non-local competitors, and emphasizing added value in niche destinations, Majestic avoids reactive pricing traps and builds durable market positioning. These strategies are reinforced by loyalty programs, flat-rate logic, and operational excellence, ensuring that Majestic competes on performance, not just price.

To mitigate the risk of **Operational Model Copy**, Majestic Air Cargo deploys a layered strategy built on **structural innovation, vertical integration, and long-term tech evolution**. By innovating in non-controlled variables and embedding founder-centric workflows, Majestic creates a defensible architecture that competitors can't easily replicate. The roadmap includes adaptive governance, proprietary simulation logic, and ESG-aligned service differentiation, ensuring that Majestic's operational model remains unique, resilient, and strategically aligned across all corridors and cargo types.

To counter the **predominance of traditional air carriers**, Majestic Air Cargo deploys a strategy rooted in **data validation, operational transparency, and structural innovation**. By simulating corridor performance, certifying contingency plans, and solving legacy pain points, Majestic positions itself as a modern, resilient alternative. Strategic advertising, institutional partnerships, and client-facing dashboards reinforce credibility and challenge the status quo, ensuring Majestic earns trust not through tradition, but through measurable excellence.

To counter **Hidden Blocks and Attacks**, Majestic Air Cargo deploys a comprehensive defense strategy built on **operational resilience, legal preparedness, competitive intelligence, and institutional transparency**. By combining contingency planning, regulatory compliance, and strategic communications, Majestic ensures it can

MAJESTIC P.L.T. PROGRAM

withstand covert interference and maintain corridor activation momentum. These strategies are reinforced by cybersecurity protocols and a proactive legal posture, making Majestic not just operationally agile, but politically and reputationally fortified

Operational / Technological Risk analysis

- **Get the Required Aircraft:** Majestic's growth depends on securing the right aircraft types (e.g., A321P2F, 757P2F) with cold-chain capability and corridor flexibility. Delays in acquisition, leasing constraints, or certification bottlenecks could stall route activation and compromise perishables-first service delivery.
- **Fleet Reliability:** Maintaining consistent aircraft performance is critical to Majestic's perishables integrity and scheduling precision. Mechanical failures, maintenance delays, or parts shortages could disrupt corridor continuity and erode client trust, especially during peak seasons.
- **Process Integration:** Majestic's modular tech-driven model requires seamless coordination between flight ops, ground handling, customer service, and financial systems. Any misalignment or integration failure could lead to operational inefficiencies, data silos, and reduced service quality.
- **External Variables (Weather):** Unpredictable weather patterns, especially in tropical and mountainous regions, pose risks to flight schedules, cargo integrity, and corridor reliability. Without dynamic rerouting and contingency protocols, Majestic may face delays or perishables spoilage.
- **Accidents / Incidents:** While rare, aviation incidents or cargo handling accidents could severely impact Majestic's reputation, regulatory standing, and insurance costs. A single event in a high-visibility corridor could trigger audits, client attrition, or operational suspension.
- **In-house Technology Development Problems:** Majestic's competitive edge relies on proprietary tech platforms for simulation, scheduling, and client interfacing. Delays in development, system bugs, or scalability issues could undermine operational efficiency and stall platform-wide deployment

To mitigate the risk of **not securing the required aircraft**, Majestic Air Cargo deploys a multi-layered strategy combining **priority financing, flexible acquisition models, client-backed demand, and simulation-driven planning**. By aligning fleet decisions with corridor logic and leveraging strategic relationships with OEMs and lessors, Majestic ensures timely access to aircraft that matches its perishables-first mission. These strategies are reinforced by volume guarantees, ROI modeling, and operational agility, making fleet acquisition a scalable and resilient component of Majestic's hemispheric logistics platform.

MAJESTIC P.L.T. PROGRAM

To ensure **Fleet Reliability**, Majestic Air Cargo deploys a comprehensive strategy that combines **proactive planning, predictive diagnostics, and integrated operations**. From aircraft reception to AOG recovery, each component is designed to maintain uptime, protect perishables integrity, and support corridor continuity. By embedding maintenance logic into the tech layer and aligning it with flight scheduling, Majestic transforms reliability from a reactive function into a strategic advantage, ensuring every aircraft is mission-ready, every corridor is protected, and every shipment arrives on time.

To mitigate **Process Integration risk**, Majestic Air Cargo deploys a structured strategy built on **IDEF0 modeling, phased implementation, and modular system alignment**. By integrating third-party capabilities, enforcing unified data governance, and investing in cross-functional training, Majestic ensures that every operational module, from flight ops to finance functions as part of a cohesive, traceable, and scalable ecosystem. This approach transforms integration from a technical challenge into a strategic enabler of corridor performance and platform resilience.

To mitigate the impact of **External Variables (Weather)**, Majestic Air Cargo deploys a proactive strategy built on **training, dynamic rerouting, real-time monitoring, cargo protection, and financial safeguards**. By embedding weather intelligence into its tech layer and operational workflows, Majestic ensures that corridor performance remains resilient, even under volatile conditions. These strategies protect both cargo integrity and service reliability, reinforcing Majestic's commitment to precision logistics in a hemispheric trade environment.

To mitigate **Accidents / Incidents**, Majestic Air Cargo deploys a multi-layered strategy built on **training, predictive safety systems, and institutional oversight**. By integrating air and industrial safety programs, enforcing all-level supervision, and embedding real-time alerting tools, Majestic transforms safety from a reactive function into a proactive advantage. These strategies are reinforced by predictive maintenance, structured incident response, and insurance safeguards.

To mitigate **In-House Technology Development Problems**, Majestic Air Cargo deploys a resilient strategy built on **modular architecture, agile validation, and operational safeguards**. By embedding testing frameworks, contingency protocols, and external benchmarking, Majestic ensures its tech evolves with corridor demands while maintaining reliability. These strategies are reinforced by strong

MAJESTIC P.L.T. PROGRAM

documentation and talent retention, making technology not just a support function, but a strategic pillar of platform scalability and founder control.

Financial Risk Analysis

- **Intensive Capital Requirement:** Majestic's model demands significant upfront investment in aircraft, infrastructure, tech development, and corridor activation. This creates pressure on liquidity and requires disciplined capital planning to avoid overextension.
- **Lack or Delay in Fund Raising:** Any delay in securing investor capital or credit facilities can stall key milestones, such as fleet acquisition, tech deployment, or market entry, impacting momentum and credibility.
- **Start-Up Risk Compensated with High Interest Rate:** Early-stage financing may come with elevated interest rates or unfavorable terms due to perceived risk, increasing financial burden and reducing flexibility in capital allocation.
- **Financial Model Strength:** Weak or unvalidated financial projections can undermine investor confidence and strategic decision-making. A robust, corridor-linked financial model is essential to justify ROI and guide resource deployment.
- **Payment Capability:** Inability to meet short-term obligations, such as lease payments, vendor contracts, or payroll, can trigger operational disruptions and damage stakeholder trust.
- **Funds Management:** Poor financial governance or lack of transparency in fund allocation can lead to inefficiencies, misaligned spending, and exposure to audit or compliance risks.
- **Company Low Profitability:** If Majestic fails to reach breakeven within projected timelines, it may struggle to sustain operations, attract follow-on investment, or justify corridor expansion.
- **Low-Cost Model Non-Sustainability:** While competitive pricing is key to market entry, an overly aggressive low-cost strategy may erode margins and compromise long-term viability if not balanced with value-added services.
- **Long-Term ROI:** Majestic's infrastructure-heavy model may require extended time horizons to realize full return on investment, demanding patient capital and strategic resilience.
- **Capital Scape:** Uncontrolled capital outflows, whether through debt servicing, investor exits, or currency exposure, can destabilize financial planning and reduce reinvestment capacity.

MAJESTIC P.L.T. PROGRAM

- **Tax Structure:** Inefficient or non-optimized tax frameworks across jurisdictions can reduce net profitability and expose Majestic to compliance risks or double taxation.

To mitigate **Intensive Capital Requirement**, Majestic Air Cargo deploys a lean, modular strategy built on **efficient structure, diversified funding, and corridor-specific capital logic**. By leveraging third-party capabilities, client-backed financing, and simulation-driven deployment, Majestic avoids overextension while preserving strategic control. These tactics ensure that every dollar invested is tied to measurable corridor impact, scalable infrastructure, and long-term platform resilience.

To mitigate **Lack or Delay in Fund Raising**, Majestic Air Cargo deploys a multi-pronged strategy built on **controlled dilution, founder commitment, milestone logic, and strategic co-investment**. By aligning capital deployment with corridor activation and leveraging short-term liquidity tools, Majestic preserves momentum and credibility, even under fundraising uncertainty. These tactics ensure that platform development remains resilient, investor-ready, and strategically paced across hemispheric expansion.

To mitigate **Start-Up Risk Compensated with High Interest Rate**, Majestic Air Cargo deploys a capital strategy built on **flexibility, partner leverage, and milestone-based instruments**. By combining refinancing options, collateral-backed partnerships, and revenue-linked repayment models, Majestic reduces financial strain while preserving growth momentum. These tactics ensure that early-stage capital supports strategic execution without compromising long-term profitability or founder control.

To ensure **Financial Model Strength**, Majestic Air Cargo deploys a strategy built on **external validation, dynamic updating, and operational alignment**. By integrating scenario planning, due diligence readiness, and investor feedback, Majestic transforms its financial model into a strategic asset, capable of guiding capital deployment, corridor activation, and long-term platform growth. These tactics reinforce trust, adaptability, and precision across all financial engagements.

To ensure **Payment Capability**, Majestic Air Cargo deploys a disciplined strategy built on **client-backed revenue, structured debt governance, and dynamic forecasting**. By leveraging LOIs, loyalty contracts, and priority coverage protocols, Majestic maintains financial resilience across corridors. These tactics are reinforced by trust-building transparency, contingency reserves, and debt limitation logic, ensuring that every payment obligation is met with precision, credibility, and strategic foresight.

MAJESTIC P.L.T. PROGRAM

To mitigate **Funds Management risk**, Majestic Air Cargo deploys a governance-first strategy built on **internal controls, planning discipline, and external validation**. By integrating audit protocols, corridor-linked budgeting, and management limitations, Majestic ensures every dollar is traceable, justified, and strategically deployed. These tactics reinforce investor confidence, operational integrity, and long-term platform scalability.

To mitigate **Company Low Profitability**, Majestic Air Cargo deploys a strategy built on **commercial precision, cost discipline, and operational agility**. By optimizing pricing, monitoring financial flows, and activating lean alternatives, Majestic ensures that each corridor contributes to platform-wide profitability. These tactics are reinforced by yield management, client segmentation, and simulation-driven cost control, transforming profitability from a static metric into a dynamic, scalable advantage.

To mitigate **Low-Cost Model Non-Sustainability**, Majestic Air Cargo deploys a strategy built on **financial agility, strategic partnerships, and corridor-level precision**. By leveraging Fresh24's ecosystem, activating tiered services, and outsourcing non-core functions, Majestic transforms cost discipline into a scalable advantage. These tactics ensure that low-cost entry does not compromise long-term viability, preserving margin, trust, and platform resilience across every corridor.

To ensure Long-Term ROI, Majestic Air Cargo deploys a strategy built on disciplined investment policies, financial efficiency, and strategic cash banking. By tracking corridor-level returns, leveraging liquidity for operational growth, and aligning asset deployment with demand signals, Majestic transforms ROI from a static metric into a dynamic growth engine. These tactics, reinforced by partnerships, reinvestment logic, and modular scalability, ensure that every dollar invested compounds into platform resilience, corridor dominance, and hemispheric impact.

To mitigate **Capital Scape**, Majestic Air Cargo deploys a strategy built on **simulation-driven financial planning, operational leverage, and progressive vertical integration**. By aligning debt terms with corridor performance, internalizing high-impact functions, and leveraging Fresh24's ecosystem, Majestic reduces external dependency and preserves reinvestment capacity. These tactics ensure that capital remains a strategic asset, not a vulnerability, across hemispheric expansion and long-term platform evolution.

Majestic Air Cargo mitigates **Tax Structure risk** through a strategy built on **entity optimization, jurisdictional alignment, reinvestment discipline, and intercompany governance**. These tactics, reinforced by simulation-driven forecasting and treaty leverage, ensure that tax planning supports platform scalability, investor confidence, and long-term corridor dominance.

MAJESTIC P.L.T. PROGRAM

Team / Management risk analysis

- **Lack of Multidisciplinary Experience Across the Admin Team:** Insufficient expertise in key functional areas such as management, operations, maintenance, commercial strategy, and logistics, can lead to fragmented execution, poor decision-making, and reduced corridor performance. **Unlimited Company Control from Management:** Over-centralized decision-making without checks can create governance risks and strategic blind spots.
- **Heavy Personnel Structure:** Excess staffing leads to high fixed costs, slow execution, and diluted accountability.
- **Founder Bottleneck Risk:** Over-reliance on the founder for decisions can limit scalability and delay execution during growth phases.
- **Talent Retention and Continuity Risk:** Loss of key personnel or institutional knowledge can disrupt operations and tech development.
- **Cross-Functional Misalignment:** Poor coordination between departments may fragment execution and reduce corridor performance.
- **Cultural Misfit in Strategic Hires:** Hiring experienced talent that clashes with startup pace or modular logic can reduce cohesion and impact.

To mitigate **Lack of Multidisciplinary Experience Across the Admin Team**, Majestic Air Cargo deploys a strategy built on **phased hiring, advisory support, cross-functional development, and strategic partnerships**. These tactics ensure that the platform scales with precision, resilience, and founder-aligned governance.

To mitigate Heavy Personnel Structure, Majestic Air Cargo deploys a strategy built on modular team design, phased hiring, automation, and strategic outsourcing. These tactics ensure that human capital scales in lockstep with corridor performance, preserving agility, margin, and operational clarity.

To mitigate **Founder Bottleneck Risk**, Majestic Air Cargo deploys a strategy built on **modular delegation, governance clarity, simulation-driven role mapping, and strategic documentation**.

To mitigate **Talent Retention and Continuity Risk**, Majestic Air Cargo deploys a strategy built on **incentive alignment, knowledge continuity, career development, and cultural engagement**. These tactics ensure that key personnel remain invested, empowered, and strategically embedded.

MAJESTIC P.L.T. PROGRAM

To mitigate **Cultural Misfit in Strategic Hires**, Majestic Air Cargo deploys a strategy built on **modular alignment, simulation-based validation, phased onboarding, and transparent governance logic**. These tactics ensure that every strategic hire strengthens, not fragments, the platform's cohesion, execution clarity, and hemispheric scalability.

Regulatory / Political risk Management

- **Bilateral Air Service Agreement Constraints:** Limited or restrictive agreements between countries can delay or block corridor activation, requiring diplomatic or regulatory negotiation.
- **Security & Screening Compliance:** Mandatory cargo screening and aviation security protocols (e.g., TSA, CBP) can increase operational complexity and risk of shipment delays or penalties.
- **Environmental & Safety Regulations:** Evolving emissions standards and aircraft safety requirements may force costly upgrades or restrict fleet flexibility.
- **Tariff Volatility & Trade Policy Shifts:** Sudden changes in import/export tariffs or trade agreements can destabilize pricing, demand, and corridor economics.
- **Currency Controls & FX Exposure:** Government-imposed currency restrictions or political instability can disrupt payments, capital flow, and financial planning.
- **Customs & Border Policy Changes:** Shifts in customs procedures or inspection protocols can delay cargo clearance, increase spoilage risk, and reduce corridor reliability.
- **Political Instability in Strategic Regions:** Civil unrest, elections, or regime changes may disrupt airspace access, logistics infrastructure, or regulatory continuity.
- **Regulatory Lag on Innovation:** Slow adaptation of aviation laws to new technologies (e.g., AI routing, digital twins) can limit operational efficiency and platform optimization.

To mitigate **Bilateral Air Service Agreement Constraints**, Majestic Air Cargo deploys a strategy built on **regulatory simulation, diplomatic engagement, alliance structuring, and legal optimization**.

MAJESTIC P.L.T. PROGRAM

To mitigate **Security & Screening Compliance risk**, Majestic Air Cargo deploys a strategy built on **certified facility integration, smart screening tech, chain-of-custody protocols, and compliance-driven partnerships**. These tactics ensure that perishables flow securely and efficiently across corridors.

To mitigate **Environmental & Safety Regulation risk**, Majestic Air Cargo deploys a strategy built on **fleet optimization, global standards integration, hazardous cargo protocols, and simulation-driven compliance planning**.

To mitigate **Tariff Volatility & Trade Policy Shifts**, Majestic Air Cargo deploys a strategy built on **dynamic pricing, supply chain diversification, treaty alignment, and simulation-driven forecasting**.

To mitigate **Currency Controls & FX Exposure**, Majestic Air Cargo deploys a strategy built on **hedging instruments, multi-currency treasury logic, legal structuring, and simulation-driven planning**.

To mitigate disruptions from shifting customs and border policies, Majestic Air Cargo deploys a layered strategy that combines **advance data submission, specialized broker partnerships, and digitized documentation** to streamline clearance and protect perishables. By proactively transmitting cargo data and securing expert navigation through local regulations, Majestic reduces inspection delays and ensures compliance.

To mitigate the risk of **Political Instability in Strategic Regions**, Majestic Air Cargo applies a proactive, multi-pronged strategy that blends intelligence, flexibility, and financial safeguards. It begins with corridor-level risk scoring to prioritize stable regions and sequence activation accordingly. Local partnerships provide real-time ground intelligence, enabling rapid response to unrest or policy shifts. Political risk insurance protects against asset loss and revenue disruption, while flexible routing ensures perishables can be redirected through compliant hubs without compromising integrity.

To mitigate **Regulatory Lag on Innovation**, Majestic Air Cargo deploys a strategy that blends early engagement, modular deployment, and jurisdictional targeting. By proactively collaborating with aviation authorities and industry bodies, Majestic builds trust and helps shape future standards. Innovations are introduced in modular phases to limit compliance exposure, while strategic rollout in tech-friendly regions accelerates adoption.

5.8. Team and Governance Team

Majestic Air Cargo operates under a **structured, performance-driven management system** that blends hierarchical clarity with operational agility. The system is designed to support corridor-based scalability, perishables-first logistics, and continuous innovation, anchored by a leadership framework that ensures strategic alignment, rapid decision-making, and cross-platform integration.

Hierarchical Structure with Strategic Alignment

At the top of the organization is a **Senior Executive Team**, composed of leaders in aeronautics, advanced logistics, and innovation systems. This team sets the strategic direction for corridor activation, fleet deployment, and regulatory engagement. Their decisions are guided by simulation outputs, market intelligence, and perishables demand signals, ensuring that every initiative aligns with Majestic's hemispheric growth model and operational priorities.

Integration with Fresh24 – Intelligence-Driven Execution

Majestic's management system is deeply integrated with **Fresh24**, its perishables intelligence and demand orchestration engine. This integration is not peripheral, it's foundational. A dedicated interface layer connects both platforms, enabling continuous data exchange around buyer/supplier dynamics, shelf-life constraints, and demand volatility.

Fresh24 provides validated requirements, such as cargo urgency, perishables sensitivity, and market-side risk, which Majestic uses to prioritize routing, adjust cargo mix, and optimize corridor sequencing. This ensures that perishables are not only moved efficiently but positioned strategically for maximum market impact.

Data-Driven Decision Making

Every layer of Majestic's management system is powered by **data visibility and simulation logic**. Operational teams access live dashboards that track corridor performance, regulatory exposure, and cargo integrity. Strategic decisions, whether activating a new route or reallocating aircraft, are backed by predictive models and risk assessments.

MAJESTIC P.L.T. PROGRAM

The system also includes a **Governance & Compliance Unit**, which monitors regulatory changes, ESG benchmarks, and geopolitical risks. This unit feeds insight into the executive team, ensuring that decisions remain compliant, resilient, and investor ready.

Organigram Designed for Efficiency

Majestic's organizational chart reflects a **tiered but modular structure**, optimized for clarity and speed. Each corridor is managed by an **Activation Pod**, a cross-functional team reporting to management. These pods include routing analysts, compliance officers, and perishables specialists, empowered to make tactical decisions within standardized frameworks.

The organigram ensures that strategic decisions flow top-down with precision, while operational feedback loops move bottom-up with speed. This dual flow enables Majestic to remain responsive, scalable, and aligned across all corridors and partner ecosystems.

6. IMPLEMENTATION SCHEDULE

Majestic P.L.T is designed as a hemispheric logistics platform with a clear, staged growth trajectory. Its implementation unfolds across three strategic phases, each building on the operational, infrastructural, and brand foundations laid by the previous one. The program is engineered to scale regional export logistics into a fully integrated global supply and manufacturing ecosystem, anchored by perishables-first logic, corridor-based activation, and founder-centric governance.

Phase I: Continental Operations

The first phase focuses on establishing continental production, trade and logistics operations, with a strong emphasis on the Colombia–USA–Caribbean trade triangle. This corridor is selected for its high perishables density, established export protocols, and strategic proximity to key North American and island markets. Majestic will deploy certified aircraft, standardized cold chain protocols, and simulation-driven routing to ensure SLA compliance and shelf-life preservation.

Within this phase, the initial subphase centers on export operations, leveraging existing certified products, such as floriculture, fresh produce, and seafood, to build operational rhythm and corridor reliability. These exports will be routed through Majestic’s dedicated charter model, with Fresh24 providing perishables intelligence to validate urgency, shelf-life constraints, and buyer-side demand.

As these operations consolidate, Majestic will launch a Supply Development Program aimed at expanding the product portfolio across the U.S. and Latin America. This initiative will identify underutilized supply nodes, negotiate corridor access, and onboard new producers into the platform. The goal is to increase competitiveness through price optimization, access democratization, and product diversity, positioning Majestic as the preferred logistics partner for perishables across the continent.

This phase also includes the deployment of Majestic’s internal GSA to manage indirect charter flights, while remaining open to external GSAs in corridors where mutual cost, infrastructure, or efficiency advantages exist.

Phase II: Global Operations & Infrastructure Expansion

Beginning in Year 3, Majestic enters its second phase: Global Operations. This phase expands trade corridors to additional Latin American countries, including Ecuador, Peru, Brazil, Central America, and Canada, while simultaneously extending Majestic’s logistics reach to Europe and Asia. These new corridors will be activated based on perishables density, regulatory readiness, and geopolitical stability, with Fresh24 continuing to guide demand orchestration and shelf-life prioritization.

MAJESTIC P.L.T. PROGRAM

To support this expansion, Majestic will begin in-house infrastructure expansion, increasing cold storage hubs, cargo terminals, and routing nodes to reduce dependency on third-party facilities. This infrastructure will be modular, and scalable, designed to lower operational costs while increasing service reliability.

A key milestone in Phase II is Majestic's entry into value-added manufacturing. The platform will begin processing select perishables into ready-to-market products under the Majestic brand, leveraging corridor intelligence to match product formats with regional buyer preferences. This move transforms Majestic from a logistics provider into a supply chain orchestrator, capable of delivering not just raw goods but branded, shelf-ready inventory.

Phase III: Full Vertical Integration

In Year 5, Majestic initiates its third and final phase: Full Vertical Integration. This phase is triggered by the scale and maturity of Majestic's operational footprint, enabling the platform to internalize key services that were previously outsourced. The goal is to reduce cost exposure, increase strategic control, and unlock new revenue streams.

Key verticals include:

- **Maintenance, Repair, and Overhaul (MRO):** Majestic's internal maintenance division will be spun out into a certified MRO unit, servicing its own fleet and offering third-party maintenance across the region.
- **Flight Training Academy:** Majestic will establish a training center to develop its own pilots, ground crew, and logistics specialists, ensuring talent continuity and reducing onboarding costs.
- **Jet Fuel Trade & Self-Supply:** The platform will enter the jet fuel market, negotiating bulk supply contracts and exploring self-supply models to stabilize fuel costs across corridors.
- **Third-Party Service Internalization:** Functions such as customs brokerage, perishables handling, and ground transport will be progressively absorbed into Majestic's operational stack, based on volume, cost efficiency, and strategic relevance.

This phase completes Majestic's transformation into a fully integrated hemispheric logistics and manufacturing platform, capable of controlling every aspect of the perishables supply chain, from farm to shelf, from aircraft to brand.

7. CAPITALIZATION PLAN

The Majestic Program requires a total capitalization of **\$242 million USD**, strategically disbursed over a **five-year horizon** to support the phased deployment of FRESH24 and Majestic Cargo. This funding structure is designed to align with corridor activation, infrastructure readiness, aircraft acquisition, and vertical integration milestones, ensuring capital efficiency and operational resilience.

Year 1 – Strategic Launch (\$77 million)

Q1: FRESH24 Deployment – \$22 million

The initial investment focuses on launching FRESH24's perishables intelligence platform and establishing its core logistics nodes across the Colombia–USA–Caribbean triangle. Funds are allocated as follows:

- Greensboro, NC Facilities & Technology \$4.5 million
Development of perishables intake, cold chain staging, and routing simulation systems.
- Gettysburg, PA Facilities & Technology – \$4.5 million
Infrastructure for shelf-life validation, buyer-side analytics, and corridor orchestration.
- Medellín (MDE) & Cali (CLO) Facilities – \$4 million
Export-side cold chain hubs and perishables certification centers.
- San Juan, PR Facility – \$1.5 million
Island corridor node for perishables aggregation and last-mile routing.
- Santo Domingo, DR Facility – \$1 million
Strategic staging point for Caribbean corridor activation.
- Operational Expenditures (OPEX) – \$4 million
Covers staffing, regulatory compliance, and initial supplier onboarding.
- Tech Platform Development – \$2.5 million
Buildout of Fresh24's demand orchestration engine, API layer, and simulation modules.

Q2: Majestic Cargo Launch – \$55 million

This tranche initiates Majestic Cargo's air logistics operations, enabling corridor activation and aircraft deployment.

- Aircraft Acquisition (2 × A321F) – \$50 million

MAJESTIC P.L.T. PROGRAM

These narrow-body freighters will service high-frequency perishables routes across the triangle.

- Operational Expenditures (OPEX) – \$5 million
Includes crew training, ground operations setup, and regulatory certification.

Year 2 – Expansion & Capabilities Development (\$25 million)

Q1: Continental Scale-Up

- Aircraft Acquisition (1 × A321F) – \$20 million
Expands lift capacity for growing demand across Latin America and U.S. secondary corridors.
- Remote Maintenance Facility Development – \$5 million
Establishes decentralized MRO capabilities to support fleet uptime and reduce third-party dependency.

Year 3 – Global Reach & Hub Optimization (\$50 million)

Q1: Intercontinental Expansion

- Aircraft Acquisition (1 × B777F) – \$45 million
Wide-body freighter for long-haul perishables corridors to Europe and Asia.
- Ground Support Equipment & Hub Operations – \$5 million
In-house cargo handling, perishables staging, in all Majestic hubs.

Year 4 – Dual Aircraft Acquisition & Brand Development (\$70 million)

Q1: operational scale-up

- Aircraft Acquisition (1 × B777F + 1 × A321F) – \$70 million
Expands both long-haul and regional capacity to support value-added manufacturing and branded product distribution under Majestic's label.

Year 5 – Final Fleet Consolidation (\$20 million)

- Aircraft Acquisition (1 × A321F) – \$20 million
Final narrow-body freighter to complete Majestic's core fleet, enabling full corridor saturation and operational redundancy.
